A COLLECTION OF PRO TIPS FOR EVERYTHING. Without being limited to a particular topic, these tips are from popular software, to coding, to browsers, search, storage rules, password rules, mobile device hacks, bios cracking, tweaks explained and everything tech under the sun.

Hidden features you probably didn't know about

The element of surprise in software is wonderful when it comes to useful features. We randomly list down a few handy ones.

DEVELOPERS DON'T ALWAYS reveal all the features offered in their software and it's up to the users to stumble upon them randomly. Although they require some digging to discover, they usually hide in plain sight. Here are eight such hidden features across different platforms and software, in no particular order.

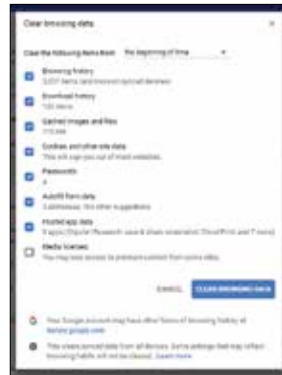

SEARCH INTO SPECIFIC WEBSITES

Having a hard time looking for a specific article on a website? Well, one way is to use search operators in Google Search or you could just use Chrome's omnibox instead. The omnibox is the address bar in the Chrome browser where you enter the domain names. By default it lets you search directly on

Google Search. But if you're looking for specific websites, say Reddit, then you'll have to make an entry in the settings. Head over to Settings > Search engine > Manage search engines. Here you can enter any website you want and if you've already opened the website, chances are the Chrome must have automatically added it to the list. If not, you can manually enter and even assign a special keyword rather than typing down the entire domain name. Once it's added in the list, if you've assigned the keyword "reddit" to reddit.com, then type down reddit and you'll see the text "Press tab to search reddit". On pressing tab, any entry you make in the omnibox will search only in Reddit.

SHORTCUT TO DELETE BROWSING HISTORY

Now, we know you must have made all the "questionable" online searches in an incognito tab. But say, you haven't, you can hit the "Ctrl+Shift+Delete" combination and the "Clear browsing data" window will pop up. Select or deselect the things

Clear browsing data shortcut

you want to delete and you're done. This enables you to delete the embarrassing history like a ninja.

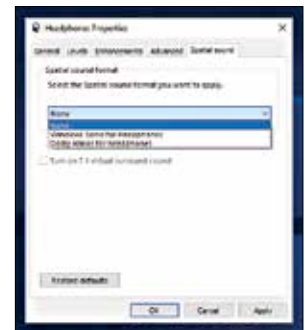

DRAW MULTIPLE TABS ON CHROME

Chrome has made it easy to drag opened tabs into a new window. Sometimes, when you're working on an assignment, you might have other websites open. To organise the clutter, you would want the relevant tabs to be open in a single window. If you're individually dragging them to the new window, you're doing it wrong. Chrome allows you to drag multiple tabs at once - just press "Ctrl" and click on all the tabs that you want to drag.

ENABLE WINDOWS SPATIAL SOUND

Did you know that you could enjoy spatial sound on Windows without any extra

software? However, you will need Creator's Update installed on Windows 10. Rather than listening to music or watching movies in regular stereo, Windows Sonic for Headphones will make the audio spatial. This feature is only available for headphones. To enable Spatial sound, head over to Sound > Playback and then right-click on your headphones to go to its properties. Open the Spatial sound tab and select Windows Sonic for Headphones from the dropdown menu.

FIND YOUR WHATSAPP BFFS

Snapchat has a feature that displays the users with whom you exchange the most snaps. If you're looking for the same on WhatsApp, it's easy to find. On Android, open up WhatsApp and go to Settings > Chats > Chat History > Email chat. You'll find three contacts or groups listed under "Frequently
