lashback to a few years ago when you first got your keyboard. You probably had a

smile on your face the entire time as you unpacked it and placed it front of your PC. Then you traced your fingers along the keys and typed your first words on the new hardware, getting a feel for what would be your companion in the coming years. Skip to the present, and now your keyboard has a budding ecosystem harbouring germs feeding on the pizza crumbs or potato chips left inside it. Most of us started off

with a membrane keyboard and cleaning them was definitely a pain in the backside. You had to open up the entire keyboard chassis to reach the inner housing where most of the filth got collected. Whereas, mechanical keyboards are comparatively easier to clean because the key caps can be easily removed. Majority of the dust is collected around the switches right below the key caps and to reach them, you don't need to open up the keyboard.

This brief guide will show you how easy it is to clean your keyboard. You should, because according to a recent study, your dirty keyboard might have about 20,000 times more bacteria than a toilet seat! This might not kill you, but if you have weak immunity, you will fall sick frequently. To begin, we'll go through a couple of regular keyboard cleaning habits that you should incorporate in your life. This will not only keep you healthy but will also improve your keyboard's life.

WEAPONS OF MASS CLEANLINESS

- Compressed air can / air dust blower / vacuum cleaner

Liquid soap mixed with warm water is the best cleaning solution for keyboards
