

Airline for millennials

Air France announces that they are working on a new airline aimed at youngsters aged 18-35 years. <http://dgit.in/joonFly>

L shaped batteries

Apple will reportedly be using L shaped batteries from LG on its 2018 iPhone to maximise use of internal space. <http://dgit.in/LiPhone>

Bringing the best of macOS features into Windows 10

Why should Mac users have all the fun?

Abhijit Dey | abhijit@digit.in

While taking a look at the Apple ecosystem in this month's FT, we stumbled upon several exclusive features that haven't made their way into Windows yet. There are several features in macOS (formerly known as OS X), big and small, that we would love to use on Windows. We've listed down some of them below along with their third-party alternative for Windows.

GO BACK IN TIME

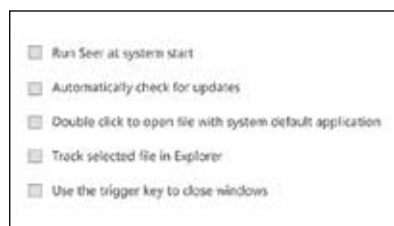

Time Machine has been quite a popular feature in macOS. In case your system starts acting up and one day it doesn't boot up, Time Machine allows you to retrieve your system. It creates system restore points at specified intervals regularly. These restore points are images created to include the state of your operating system during that particular date, while saving all your files and settings. We don't have an equivalent tool for Windows, although the next Fall Creator's Update for Windows 10 might add this feature. Your best bet for an alternative would be either

Genie Timeline or CrashPlan. Out of the two, the first one is similar to Time Machine but it isn't free whereas the second one is free.

QUICK PREVIEW

While browsing through files on your system, macOS users can preview them without actually opening them. Pressing spacebar after selecting the file opens a window which gives you a quick preview of the files. The same feature can be brought to Windows with the help of

Seer. You can not only preview audio, video, and PDF files, but you can also preview Microsoft Office files, AutoCAD, code, and HTML files. These aren't available by default but as plugins that can be downloaded from within the software.

EASY SCREENSHOTS

There's a tool built into the macOS that lets you easily take screenshots. On Windows, you either have to hit "Print Screen" then paste it in Paint and save the image or you have to use a Snipping Tool. Although the Snipping Tool makes life easy on Windows, Lightshot goes further and makes it even easier. After its installation, the application gets assigned to your "Print Screen" key and whenever you hit the key, it asks you to select the area and you have your

screenshot. You can also annotate and highlight the screenshot, and then save it to your drive.

UNIVERSAL SEARCH

Searching for files or launching an application on macOS, both these tasks are made simple with Spotlight. A similar tool on Windows was absent and alternatives such as Alfred and Launchy were used. Although Cortana brought in universal search, Wox consists of extra features that makes it more powerful.

UNIVERSAL CLIPBOARD

There must have been times where you came across a desktop website on your phone and wanted to open it up on your Macbook. Apple made sharing of text, photos, and videos easier with their Universal Clipboard feature under Continuity. Essentially, anything you copy on your iPhone, you will be able to paste it in any other Apple device. The only requirement being that it needs to be the same iCloud account. This can be achieved across all your devices, regardless of the platform using an application called Pushbullet. This application consists of a chat menu where you can authenticate all your devices and share text, photos, and videos to any connected device. All it needs is the application to be installed on those devices with the same account logged in.
