UK to ban fossil fuel cars

In an announcement similar to France, UK aims to ban petrol and diesel cars by 2040. <http://dgit.in/ukfcarban>

Jabees BTwins

Truly wireless but truly ordinary as well.

Jabees have built quite a portfolio of which the BTwins caught our eye.

The two bullet-like ear buds feel quite sturdy and despite having to cram the battery, drivers and other circuitry within the same housing, they aren't too big. When inserted into your ear they won't protrude too far out.

The Jabees BTwins score pretty high on features. Firstly, they are truly wireless in-ears, which means not only is there no wire connecting them to the audio source, but the individual ear pieces aren't tethered to a wire either. They're IPX4 rated and come with a carrying case that has an inbuilt 450mAh battery which can charge

your earbuds on the go. One of the biggest problems with the Jabees BTwins is that the line balance is off – the right channel is discernibly louder than the left. They are overtly bass heavy. The bass is boomy and the only redeeming aspect is that it can go quite low

as well. The super enhanced lower mid range makes instrument dense tracks sound muddled and hollow. The claimed battery life of three hours of music playback holds true more or less but the audio performance was much lower than what I expected.

If the novelty of owning totally wireless headphones supersedes every other requirement you should go for the Jabees BTwins. As far as sound quality goes they aren't as bad if you ignore the line balance issue. But if you are willing to tolerate a wire running between the two earbuds you could get much superior audio quality at ₹7999 while still being relatively wireless.

—Siddharth Parwatay

SPECIFICATIONS

BLUETOOTH PROFILE: HSP/HFP/A2DP/AVRCP | OPERATING DISTANCE: 10 meters | MUSIC PLAYBACK TIME: 3 hours | CHARGING TIME: 2 hour | PRODUCT DIMENSION: 14.4mm x H 16.3mm | WEIGHT OF EARBUD: 4.5g

ASUS ROG Pugio

The kind of modularity that we love

The ROG Pugio goes beyond offering just modular side buttons by providing swappable micro-switches for the left and right clicks. The push-to-fit design allows you to swap the switches easily. The default Omron D2FC-F-K switches have a lighter actuation force of 75 gf with a durability of 50 million clicks. Additionally, you get two extra Omron D2F-O1 switches which have a heavier actuation force of 150 gf. Essentially, you have the option to switch between a heavier or lighter feel. They also act as spare switches in case the existing ones stop working. The mouse comes with covers for the side buttons, in case you want to use only one side. The Pugio

has a beautiful RGB strip at the bottom. There are two CPI levels that can be changed from the Armoury software. The mouse supports three profiles that can be toggled with button combinations from the mouse. All the changes you make on the software will be stored on the mouse.

Fast swipes drastically affected the sensor's tracking at higher CPI levels.

We didn't experience any acceleration, nor does the sensor spin out on quick swipes. Playing at around 800-1200 CPI or anything lower should work fine. Sensor tracking at higher CPI levels does become jittery. It's not unplayable, but we wouldn't recommend this mouse for competitive FPS gamers. Features such as extra micro switches, wonderful RGB lighting, and onboard storage of profiles, combine to make the ROG Pugio a great choice for casual gamers.

—Abhijit Dey
