PERFORMANCE

When it comes to gaming, both the devices ran every game we threw at them with ease.

As far as loading is concerned, there is a difference of about 5 seconds which isn't much. We clicked on the Injustice 2 icon on both the smartphones at the same time and the difference in load time was between 3 to 5 seconds, where the OnePlus 5 loaded the game 3 seconds faster and once 5 seconds faster. Since the game relies heavily on internet connectivity, your internet connection will also determine some of the load times.

When it comes to everyday performance, both the smartphones ran everything we threw at it with absolute ease.

When it comes to the camera, both the devices sport a dual camera setup. Unlike other Huawei products we've seen, this one doesn't house the Leica branding. Both the RGB and monochrome sensors on the Honor 8 Pro are 12 megapixels. The logic behind the two sensors remains the same as previous Huawei devices – more light for better pictures. With some software mumbo jumbo, the Honor 8 Pro combines data from both sensors for good looking images. The OnePlus 5 on the other hand follows the philosophy

followed by the iPhone 7 Plus where one is a wide-angle lens and the other is telephoto lens.

When it comes to well-lit situations, both the smartphones perform well. Put the images side-by-side however, and you will see that the Honor 8 performs slightly better. The details are good and the colour reproduction is quite accurate.

In low lit situations however, the OnePlus 5 excels in comparison to the Honor 8 Pro. The Honor 8 Pro captures less light when compared to the OnePlus 5, making images noisy. In low lit situations, the OnePlus 5 retains more details when compared to the Honor 8 Pro.

When it comes to the bokeh effect on the OnePlus 5, you have to be at a specific distance from the subject to capture the effect. In practice, this means moving back and forth to get into perfect position. The image that's produced does look good, but you can't control how blurred you want the background to be. On the Honor 8 Pro, you can control the amount of blur after the photo has been clicked. You can also change the object you want to blur in the image. So, if you want to blur the background, you can do that, or if you want to blur the subject, you can do that as well. The effect can look quite artificial if you put the blur settings on maximum, but the presence of so much control in post-production is appreciated.

In our PCMark battery test, the Honor 8 Pro lasted for 517 minutes whereas the OnePlus 5 lasted for 750 minutes. The Honor 8 Pro has a 4000mAh battery whereas the OnePlus 5 has a 3300mAh battery. Apart from hardware and software optimization for battery, one of the biggest battery guzzling components is the display. The Honor 8 Pro has a 2K display whereas the OnePlus 5 has a 1080p display. Rendering fewer pixels on the display means that the battery will last longer on the OnePlus 5.

VALUE FOR MONEY

The Honor 8 Pro is available in one

variant only (6GB RAM and 128GB storage) priced at ₹29,999. The OnePlus 5 comes in two variants (6GB RAM and 64GB storage and 8GB RAM and 128GB storage) priced at ₹32,999 and ₹37,999 respectively.

The Honor 8 Pro brings with it a great design, good camera for well-lit situations and overall smooth performance. On the downside, the viewing angles of the display and brightness could have been better, along with low light photography.

The OnePlus 5 on the other hand has a brighter crisp display, good camera for low lit situations and overall smooth performance, along with good battery life.

CONCLUSION

Ultimately, it boils down to which UI you prefer, as all other aspects are nearly at par. Yes, the Honor 8 Pro offers expandable storage and 128 GB storage straight out of the box for a cheaper price. If you are one looking for raw performance, good low light photography and good battery life, then the OnePlus 5 is the one to go. But if design, cool camera trickery and 128 GB plus expandable is what you are looking for, then the Honor 8 Pro is the one for you. Simply put, you can't go wrong with either of these phones.
