

**Fast Kat Neon**

FastKat Neon is a fast-paced browser game which will challenge the speed at which you control your mouse. <http://dgit.in/fastkat>

**Box Tower**

Box Tower challenges your click timing. How high can you go before your tower crumbles? <http://dgit.in/boxtower>.

ELEMENTARY

The fight for the best old hardware-friendly and minimalist Linux distro is raging on, and we have two contenders.

Abhijit Dey | abhijit@digit.in

Our coverage of Linux has dwindled over time. In hopes of breathing life into it once again, we're starting off with a head-on between two distros. Elementary OS is a popular Linux distro that made a lot of news upon its release. It gained eyeballs mainly because of its beautiful interface. Capable of running on old hardware and offering the essential packages, Elementary still has a high popularity among Linux users. With basic support for multimedia playback and games, you'll feel right at home. Also, last year's "Loki" upgrade saw few changes including a new software manager called AppCenter, and a new default browser Epiphany.

Moving over to our contender, Enso OS, it's a fairly new distro which was launched this year in May. While it's not as stripped down as Elementary, Enso 0.1 contains most of your essential packages. This also follows the clean and simple desktop approach with a minimalist desktop. Another similarity is its support for old hardware. Currently in its maiden version, there aren't too many massive bugs that hamper basic functionality in the desktop applications.

Both the distros are based on Ubuntu, hence you will be able to notice the similarities while installing them.

TESTING RIG

The testing for this head-to-head comparison of Linux distros was done on a Liva Core mini-PC with the following specifications:

- Processor: Intel Core M-5Y10c
- Display: Intel HD Graphics 5300
- Memory: DDR3L 4GB
- Storage: Intel 535 Series 120G M.2 SSD
- Networking: Wireless Intel Wi-Fi 802.11ac & Bluetooth 4.0

Since both the distros are directed towards old hardware, we used a mini-PC with low specifications to be fair.

INSTALLED APPLICATIONS**ELEMENTARY**

Since Elementary includes the bare minimum requirements for applications, there are only 38 packages installed. Total time until it reaches the login screen is just around 22 seconds. You'll get basic applications which aren't rich in features but get the job done. Among the lot, they include Scratch (a text editor), Epiphany (a minimal web browser) and basic applications for photos, music, videos, mail, calendar, etc. To use the operating system as a daily driver, we had to install applications such as LibreOffice and Firefox (more about this later). AppCenter is a nice portal to discover applications and searching is blazing fast. This certainly makes it easy to install the missing but essential applications you might need to use the operating system daily.

ENSO

There are around 62 applications installed by default. The distro takes around 24 seconds from start up to the login screen. Speaking of the highlighted ones, it includes Ristretto Image Viewer, Atom (text editor), Firefox web browser, Pidgin Internet Messenger, Thunderbird Mail, Transmission BitTorrent Client, LibreOffice suite (Calc, Math and Writer), and Parole Media Player. You will be able to carry out all your daily routine work with these applications without installing additional ones. Multi-tasking might take a hit when you're trying to simultaneously use multiple applications. Among the default applications, we had to replace Parole Media Player with VLC media player for better and stutter-free playback. Also, the Software Center needs improvements in terms of numbers and categories for easier discovery.
