Red Hydrogen One

The company behind the high-end cameras that are used to shoot blockbuster movies is launching a smartphone. Dubbed the Hydrogen One, Red calls it the “world’s first holographic media machine.”

Yes, you read that right, holographic. The Red Hydrogen One has a 5.7-inch holographic display which runs on Google’s Android OS. In a press release from Red, they mention that

the Hydrogen One can seamlessly switch between traditional 2D content and 3D holographic content. It will come with support for “Hydrogen 4-View content”, a file-type produced by Red. This content will be stored on Red’s channel and from here users will have access to holographic content like games and movies.

It’s the world’s first such smartphone, so it’s definitely not cheap, much like their cameras. The Aluminium model of the Hydrogen One will set you back by \$1195 (₹77,000 approx) and the Titanium version will set you back by \$1595 (₹1,02,000 approx). As no other details are available right now, it might be safe to say that the prices may change as Red approaches closer to their planned release date of early 2018.

Orwl

With the recent WannaCry ransomware attack a lot of people have cyber security on their mind. If you want to take security to the extreme though, you should get yourself an Orwl.

Orwl, claimed to be the first ‘open-source physically secure computer’, buffs security not just on the cyber side of things but on the physical side of things as well. There’s a mesh inside the Orwl to protect its fragile internals. The motion-sensor and pressure-switch further add to the device’s physical security features. It comes with secure boot technology and firmware updating. The motion-sensor helps prevent shock-based data loss. All of this fits into the palm of your hand.

Orwl has been built from the ground up with security in mind. You’ll need more than a password to get into this PC. You’ll need a wireless keyfob as well. This keyfob acts as an actual key. How? The workstation goes into lock mode when the key is more than 10 metres away. When Orwl goes to sleep, it actually shuts off the USB and HDMI ports.

As a last resort during any attempted tampering, if all else fails, Orwl will wipe all data off the encrypted SSD. By self-destructing. Sort of.

SPECIFICATIONS

OPERATING SYSTEM: Qubes OS/Ubuntu/Windows | Intel HD Graphics 515 300/1000MHz | Up to 8GB RAM (1,600MHz) | Up to 480GB self-encrypted Intel solid-state drive | 802.11 n/ac wireless (up to 800 Mbps) | Dual mode Bluetooth 2.1, BTLE4.2 | One HDMI 4k video output | Two USB-C outputs |

PRICE: \$1,699 (₹1,09,400/- approx)

Kano Pixel Kit

The Kano Pixel Kit is a neat little learning tool that can help kids code in a fun and easy way. The kit itself arrives disassembled and needs to be assembled by following the instructions in the manual. The manual is easy to follow and has been specifically designed to be kid-friendly. Kids can easily follow the manual and put the Pixel Kit together in a step-by-step manner. Once that’s done, connect the Pixel Kit to your

computer, install the Kano app and get coding. Pixel Kit lets you code the various blocks on it and light them up to create

animations and do various actions. It can even detect sound and can be coded to react to sound. Kids can see the effects of the code they’re making take place live on the Pixel Kit. You can start small but eventually expand to much more complicated codes and scripts. The Pixel Kit is great for both beginners and experienced users to have fun on.

You’ll need the Kano app to run the Pixel Kit. It comes with community features to help you code/program better with more and more creations being shared on the app by users regularly.
