GALAX SNPR RGB Mouse pad

W

hile your PC cabinets and components were being given RGB makeovers, mouse pads also went through the same transformation. Not the first in the market, but the SNPR RGB mouse pad from GALAX is the first to arrive at our test labs. Everyone's initial reaction was why would you even buy one, until all of them called dibs on having it permanently attached to their rigs. Who doesn't want a bit of eye-candy right?

The mousepad has a strip of LEDs running on its edge on three sides. At the bottom edge, the GALAX logo is also lit with LEDs. On the top, there are two buttons to control the lighting effects. The button on the left allows you to cycle through the seven lighting modes and the button on the right lets you cycle through seven colours and RGB. This means when you've enabled one mode, you will be able to cycle through the colours in the same mode. Although, in the spectrum mode, there's only RGB where it's a nice colour shift effect. It doesn't have any software support so if you need a specific lighting effect, you'll have to cycle through all of them.

Speaking of its primary function, the SNPR is essentially a hard mouse pad with a slight texture on the surface. This is where it gets subjective since some people prefer speed whereas others prefer some control on their mouse pad. Your mouse will glide easily on this mouse pad which can improve gameplay if you're comfortable with hard surfaces. The bottom of the mouse pad is lined with a textured rubber pad that prevents it from slipping on the surface. With a braided cable and quality materials, we're quite confident in saying the mouse pad is well built. The SNPR mouse pad is far more expensive than regular cloth mouse pads. But then again it's not for pure practicality, it's for that little extra RGB swag (hey we're not judging here!)

If you want to match your gaming rig's colour scheme with your mousepad, go for it.

Moleskine Writing Set

T

he Moleskine Writing Set, sold in India by premium stationary brand William Penn, combines the feeling of taking notes on an actual piece of paper with the convenience of storing your notes digitally. The set that we received consisted of a 'Paper Tablet' notebook having proprietary paper with Invisible NCode™ technology and a smart pen 'Pen+'. For the entire thing to function together you will also need to install the Moleskine Notes app on your phone. Thanks to the NCode tech, the Pen+ always knows where it is inside each notebook and also recognizes the particular Moleskine notebook model among variants.

Follow the instructions in the box and within minutes you'll be jotting down notes, creating drawings, and scribbling diagrams on the notebook and they'll be seamlessly available on the Moleskine Notes app (iOS and Android) in real time. The app also allows you to choose the pen thickness and colour, so the possibilities of what you can store digitally is endless. Another very useful feature is transcription - which is supported for multiple languages such as English, Russian, Chinese and more.

Variations in handwriting largely do not affect the accuracy of transcription. Overall, the writing set is a brilliant piece of tech for someone who wants to retain the charm of old school writing and yet retain all their notes in their smartphone.
