

Sharp Plasmacluster Air Purifier (IG-GC2)

If it's been some time since you took your car out for a drive, you're probably prepared to be greeted by that dank, musty odour right when you open the door. At most times perfume-based car fresheners don't make the cut and the odour takes time to dissipate. To speed things up, an air purifier is a good solution. The IG-GC2 purifier is a small form-factor air purifier that can be placed in a car. It will ensure that your car becomes odour-free in a matter of minutes. The two filters installed at the lower end of the purifier are capable of restricting the passage of PM10

particles which includes dust, pollen and smoke (to an extent). It also claims to remove microbes that might include allergens and viruses. One downside to the purifier is the absence of a battery inside which means that you need to have it plugged in to operate. The box includes a USB car adapter with two ports so that you can have one extra port to connect your mobile device. By the way, this can pretty much act as a desk air-purifier as well

FiiO A1 Portable Amplifier

Most of us have moved away from dedicated audio players and have begun using our phones instead. But the thing with phones is that they generally don't have a great audio processor which is where the FiiO A1 comes into play. The FiiO A1 looks very similar to the E5 in terms of its design and comes with a couple of replacement clips as well as two 3.5mm male-to-male TRS cables of varying lengths and a USB micro cable for charging the device.

We've eked out about 7 hours of battery life from the FiiO A1 on its Bass 3 preset. Speaking of presets, there are 4 of them which can be switched by tapping on the power button. The first profile is neutral with the remaining three profiles have varying bass signatures that go up in magnitude with each profile. For the cost, the FiiO A1 is a very good amp to start off with to get the most out of your headphones.

Lightspeed DRYFT

The DRYFT is a crowdfunded e-cycle that wants to combine technology with an eco-friendly design to solve your rush hour commute problems. With a range of 50kms and a top speed of 25 kmph, the bike promises to go on for at least a couple of hours before running out of juice. That is, if you're running at top speed for two hours straight! The bike is pretty fast – you can feel the acceleration when you pull the throttle. There are quite a few interesting features in the bike as well like five levels of pedal boost and an LCD display that lets you know the current battery level, walk assist level, pedal boost level and more. In terms of the build quality, there were some issues with the unit reviewed by us. You also have the option for safety and lifestyle additions like mudguards, rear view mirrors, carrier and more for comprehensive packages priced around the ₹1,000 to ₹2,500 mark.

Along with the bike, you also get a warranty on the battery, the electronic parts as well as the bicycle parts. The frame and the motor have a warranty of two years. You can also check out the GLYD – a cheaper e-cycle available from Lightspeed in the same crowdfunding campaign as DRYFT.
