

Less Rockets for Mars

Elon Musk's Mars rocket may be about to lose half of its engines in a bid to make the rocket fit in existing factories. <http://digit.in/reducerocket>

Uber vs Didi

Partner Didi Chuxing is apparently freezing Uber out of Southeast Asia by investing \$2 billion in regional arch-rival Grab. <http://digit.in/ubervdidi>

The biggest brains in physics are working on something with the word 'teleportation' in it. Surely, that means the next time you're hungry, you mother can whip up something delicious back home and 'beam it up' to your desk at work? Not quite. Not even close, actually...

Aabir Abubaker | feedback@digit.in

There has always been a bit of an issue explaining cutting-edge technology to the layman. It's always been hard for scientist to dumb things down to the level of us laymen. In fact, the more the expertise of the scientist, the harder it is to think like those of us essentially ignorant on the topic.

Three things can happen when a new technology or science enters the general population's life.

Frist, they simply don't care – think grandparents and smartphones.

Second, they hate it and oppose it vehemently – when the first steam-

powered trains starting running in the UK, doctors all over the country said the human body was not built to go over 10 miles an hour, and that uterus would fly out of the bodies of women! When telephone lines were being set up all over the US, a devious postmaster arranged for the workmen to be shot and killed in order to stop it. He was convinced that he would lose

his job because nobody would send letters any longer. Good call postmaster... not on the murders, obviously, but on the death of letters.

Third would be people who choose to wholeheartedly accept the new technology. Think of A.I. – everyone and their uncles are convinced that it's the next big thing and should be chased after, even though some very smart people warn against it. Quantum teleportation would be one of those things that would sit squarely in the third category.

It sounds absolutely awesome: it has something to do with quantum physics and has the word "teleportation" in it! How could it not be cool?

Let's rip the band-aid off real quick here. Quantum teleportation is probably never going to be sending you a

This man has no clue what he's doing.
