A COLLECTION OF PRO TIPS FOR EVERYTHING. Without being limited to a particular topic, these tips are from popular software, to coding, to browsers, search, storage rules, password rules, mobile device hacks, bios cracking, tweaks explained and everything tech under the sun.

How to get Android Oreo features on older phones

Most of us cannot expect to get Android Oreo anytime soon. But that doesn't mean we can't get its features!

QUICK FACT CHECK -

ANDROID NOUGAT, the previous version has only managed to make it to 13% of Android devices as of August 2017. So it might be a good idea to not wait for Oreo. On the other hand, if it's all about the features, there are a bunch of handy tricks to bring them to your phone which is still on Marshmallow, Lollipop or in some cases, even KitKat.

GET LAWNCHAIR LAUNCHER

Developed by senior XDA member "deletescape", Lawnchair launcher is a Pixel launcher that'll get you most of the features that Android O packs. You do not need root access for this one. Get the latest release of the APK here: <http://dgit.in/LatestRLs> and install it on your phone to get the launcher. With this launcher installed, long press on any empty space on the home screen and tap Settings. On the screen that opens, here's how you can quickly enable a few Android Oreo features on your phone.

- **Notification Badges:** UI > Notification Badges and Preview then allow Notification Access.

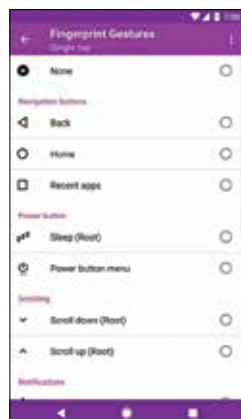

- **Adaptive Icons:** Pixel Style > Use Pixel Icons.

And there are quite a few other toggles that can make your phone more Pixel-like.

GET FINGERPRINT SENSOR GESTURES

Android Oreo brings with it support for gestures on your fingerprint sensors. Actions like single tap, double tap, and swipe will allow you to perform certain tasks on the Android Oreo smartphones.

But if you want the same features on your phone that is not scheduled for Android Oreo, then you can install Fingerprint Gestures (<http://dgit.in/FingGest>) or Fingerprint Quick Action (<http://dgit.in/FingQA>). You have access to a wide variety of actions to be assigned to the gestures mentioned earlier.

TWEAK YOUR NOTIFICATIONS

Android Oreo has a lot of helpful notification oriented features. For instance, you can snooze notifications for later. This helps you avoid notification clutter without missing out on important notifications. Use Notif Log notification history (<http://dgit.in/NotiLog>) app to get the same snooze functionality and more, albeit in a different app altogether. The app allows you to enable a floatie that swaps your Android notification bar with

its own notification panel.

On that panel, you can swipe notifications left to snooze them for 10, 20 mins or any specified time. You can also manage other features like pinned notification and more.

MAKE YOUR WIFI SMART

Another interesting feature from Android Oreo is the Wi-Fi Assistant that automatically connects you to open Wi-Fi networks around you and secures the same with a VPN from Google. While getting exactly this feature may not be possible right now, you can get something similar with all known Wi-Fi hotspots with Smart Wifi Toggler (<http://dgit.in/Smrt-WiFi>). The app can remember all your hotspots and toggle Wifi when move within and beyond the range of a known Wi-Fi hotspot. Not exactly the same, but we'll have to do with this for now.
