

Treating poop in Antarctica

Seals and penguins in Antarctica are being exposed to high levels of fecal bacteria thanks to all the poop from scientists in Antarctica. <http://digit.in/IcePoop>

Lee Jae-yong is going to jail

Samsung's vice chairman and the company's heir Lee Jae-yong has been sentenced to 5 years on charges of bribery. <http://digit.in/Samsungjail>

Samsung QLED Q8C

Sony OLED A1

Cream of the crop

Samsung and Sony have launched their flagship televisions for the year, and both take television viewing to new heights. But which one is better?

Prasid Banerjee | prasid@digit.in

A

s far as India is concerned, LG was the first to bring us OLED televisions. Having tested some of those

OLED TVs over the past couple of years, the technology's prowess is beyond question. However, LG's TVs were expensive and beyond most of our reach. So are the televisions we're comparing today, but Samsung and Sony's new TVs are strikingly cheaper than they used to be some years ago. The hope is that companies will eventually achieve enough volumes to bring it to us, the lesser souls.

The Samsung QLED Q8C is part of Samsung's 2017 flagship line, as is the Sony OLED A1. We tested the 65-inch editions of both televisions.

Note: We would have ideally had LG's OLED E7 as well, but unfortunately the company was unable to send

it in time for the magazine to go to print. The online version of the comparison will include that TV too.

BUILD AND DESIGN

Samsung's design language includes a curved television with a chrome metallic finish, while Sony uses an ultra-slim and minimalistic design, accented with glass on the back.

Both televisions are built to hide wires from plain sight. Samsung does this using what the company calls an "invisible cable" and its proprietary OneConnect box. The invisible cable is essentially a transparent cable that connects the television to the OneConnect box, which in turn acts as the hub for all your other cables. Once connected to the OneConnect, you can hide the rest of the cable. Additionally, while the cable is really long, to allow the OneConnect to be kept far away from the TV,

it is wound around a circular frame to make it simpler to hide.

On the other hand, Sony's television uses a hybrid laptop-like approach to hide all wires. You may not notice it at first, but the TV is tilted backwards by about 5 degrees when placed on a tabletop. There's a kickstand that fits behind the TV and remains invisible to those looking at it from the front. The kickstand attaches to the glass back of the TV, and itself has a mesh-like cover on top, which hides all the ports, barring a single USB port. The idea is to hide as much of the cable as possible, although almost all the ports here are facing downwards, making it quite difficult to attach cables to the port.

While both solutions do hide cables ably, Samsung's method seems much simpler and would be easier to manage. Neither of these TVs are meant for the average buyer.
