

New camera tech for satellites

A Finland-based microsatellite company is working on a new technology for satellites that can image Earth at night and through clouds <http://dgit.in/NightEarth>

More emojis for Facebook

Facebook has rolled out 125 new family emojis expanding the default yellow to include more skin tones and family combinations. <http://dgit.in/FBemoji2>

Intel Core i3-7350K vs AMD Ryzen 3 1300X

The budget segment is the most popular one in India, here's how two popular CPUs stack up against each other.

Mithun Mohandas | mithun@digit.in

T

he competition in the CPU space has certainly intensified with Intel having released its first

unlocked Core i3 processor under the 7th Gen lineup earlier this year and AMD joining in the fray with its Ryzen 3 series. Frankly speaking, the Intel Core i3 7350K was launched way earlier and thus was not intended to compete with any of AMD's CPUs since Intel had since long gone ahead with its power efficiency and better performance. AMD's Zen architecture yanked it back into the race and the Ryzen 3 1300X makes for a great budget PC CPU. Having seen what the Ryzen 3 1300X can do, we await with

bated breath to see how Intel will respond to it with the 8th Gen desktop CPUs that are to be launched later this year. As of now there is no confirmation but the Intel Core i3 8350K had its specifications leaked last month and it's reportedly shaping up quite well as a quad core, non-HyperThreaded Coffee Lake-S CPU clocked at 4.0 GHz. These numbers are purely based on rumours but should it turn out to be true, then it'll be right in line with the Core i7 CPUs based on certain benchmarks. Obviously, the Core i7 with its HyperThreading has a significant advantage across the board, but an i3 CPU equalling i7 CPUs from a couple of years back is big news.

Both CPUs have unlocked multipliers and are clocked pretty high. The Intel Core i3 7350K has 2 cores and 4 threads while the Ryzen 3 1300X has 4 cores giving it an advantage. With regards to clock speed, the 1300X starts off at 3.5 GHz and goes up to 3.7 GHz and should XFR kick in, it'll hit 3.9 GHz while the 7350K has a non-turbo clock which is 4.2 GHz. But with Speed Shift and Speed Step, it offers different power steps and quick switching between the same. As for memory, the 1300X has double the L3 cache at 8 MB and 4 times the L2 cache at 2 MB. TDP for both CPUs are very similar but the Intel 7350K is lower by 5W. Let's see how these CPUs perform out of the box.
