

Kiwi P1

We geeks usually like to measure everything, and we mean everything! However, it's irritating to try and carry around measuring tape on you all the time, and so we end up using all sorts of old school methods like using our hands and fingers to get approximate measurements. Sound familiar?

The Kiwi P1 is the perfect solution to your woes. It measures using a laser with precise accuracy (error margin is give or take 2mm). It's super simple to use, and has only one button – literally point and click. Place a stopper at the end to indicate to the P1 how much needs to be measured, and that's it, you have an accurate measurement. The P1 comes with an attachment that makes vertical measuring easier as well.

It's tiny, and is something you can leave in your pocket or bag and forget about it. A very handy tool to have, especially when interior designing or planning furniture construction or purchases.

PodCase

The PodCase is a case for your iPhone that also acts as an expanded battery, a place for you to store your AirPods, and also gives you the ability to charge them.

Ever since Apple ditched the headphone jack, you either had to rely on AirPods or headphones that had a Lightning connector, or buy a Lightning adapter for your 3.5mm jacks. The problem with the wireless AirPods is that people would keep losing them. The price you pay for having wireless earphones is the inability to secure them to your phone or your backpack, etc. as you would do with a normal set of earphones. Plus, AirPods aren't cheap (then again what Apple product is?) The PodCase is the perfect solution to that problem. Even without the charging capability this was much needed, but with that ability, they're a must have!

The case is pretty slim otherwise, but gets a little bulky at the top, because that's where the AirPods go. It's essentially a 2500mAh battery, which can charge your iPhone fully once, or charge your AirPods up to 40 times. There's no hassle of remembering to charge the case, because it's all just one connector to charge the phone and case simultaneously.

While the PodCase is currently only available for the iPhone 7 variants, they're already working on designs for the iPhone 8 as well.

Powerup Dart

Flying paper airplanes is something we've all done as kids. At some point we've tried designing our own paper planes only to see them fail miserably, crash spectacularly, and occasionally poke someone in the eye. While all of that sounds like a lot of fun, what's even more fun is building a paper plane that can do tricks! Exactly what Powerup Dart was built for.

Powerup Dart paper airplanes are designed to be able to perform aerobatics likes loops, flips, barrel rolls and more; stuff you never thought you'd see paper airplanes doing! There are different types of paper planes to choose from, and you fold the one you like yourself. Once you're done folding your plane, all you need to do is attach the DART module to the plane. This module connects to the Powerup Dart app

as well, and that's it, launch your plane and use the app to do whatever you like with it.

The standard Powerup Dart kits also come with landing and launching gear, so you don't even need to throw them into the air yourself – just accelerate using the app and the plane will take off on its own. How lazy can one really get? The campaign

page showcases six different paper planes, all of which look cool.

The Dart module is pretty sturdy – made with carbon fiber and nylon reinforced plastic – so it won't break when the plane crashes. The DART app is available with both iOS and Android, and you can find it on Kickstarter.
