The last thing that Google needs to focus on is picking brands that focus on the offline markets as well. Which means, Google needs to get Oppo or Vivo onboard the Android One programme or it has to get its existing partners to focus on offline in a large manner. Since Oppo and Vivo have established a pretty good offline

network, the easy way is to simply get Oppo or Vivo to release an Android One smartphone. This way, it's not just those empowered by the internet but even the average Joe can get themselves an Android One device. Hopefully, this time around, Google should be able to make the Android One programme stick. **4**

BUYING ADVICE

UPGRADING FOR PUBG

Q Hey Digit, I've been reading about you guys playing PUBG and I decided to take the plunge as well. However, I soon realised that PUBG brings my system down to its knees. Also, it's been a couple of years since I've upgraded my system, so I thought, why not go ahead with it right now. Which is why I'm asking for your recommendation for a nice rig that's capable of everything under the sun. Oh and yeah, It should be able to play minecraft and PUBG! Here's my configuration:

- Intel Core i5 2500
- 4 GB DDR3 RAM
- 1 TB Hard Drive
- NVIDIA GTX 460 Graphics card

—Shashi T.

A Hey Shashi, I'd advise you to wait one month before jumping in for a new rig. That's because Intel's new 8th Gen lineup will be out for desktops and they're pegged to be quite good. And even if that doesn't turn out to be so, you'll probably see AMD dropping their prices across the board to make their

CPUs seem better. So either ways, you'll end up getting a better deal. Since you haven't mentioned your budget, we're going to take PUBG as the benchmark for coming up with the configuration.

We're going to discount previous gen graphics cards since it's plain better to with the newer gen cards regardless of the GPU manufacturer, it could be AMD or NVIDIA. However, should you get a good deal, then anything above the GTX 970 can hit 60 FPS in PUBG. With the 10-series, the bare minimum is the GTX 1060 and if you wish to go with AMD, then the RX 480/580 is what should be your starting point. However, we've noticed that certain locations can result in FPS drops on the RX 480/580 so you might have to scale higher to the VEGA 56/64.

As for the CPU, we've noticed that there is a significant improvement in performance while switching from a Core i3 to a Core i5. However, anything over 4 cores doesn't result in a noticeable performance bump. There's a flag for the executable (-USEALLAVAILABLECORES) which forces the game to use as many cores as available and that didn't produce a significant bump either. So for your new CPU, pick a Ryzen 7 1700 or better and if you wish to go with Intel then the new Core i7 8700K which will launch in early October 2017. As for the motherboard, you should opt for a B350/X370 board for your AMD CPU or a Z370 board for your upcoming Intel CPU. Pick any RAM kit that does 2666 MHz as the base frequency and ensure you have 16 GB at least. Running PUBG on normal settings at 1080p resolution can take up more than 6.1 GB easily, so it's better to get 16 GB and not 8 GB. For everything else, you can opt for the high-end gaming rig from our Killer Rigs section. **4**
