Veative currently offers more than 300 modules which combine 3D, virtual, augmented, and mixed reality content and teaching tools to provide an innovative learning experience tailored to suit every classroom. The topics currently include biology, chemistry, physics, and maths and all modules can be easily adapted for any language. They include 3D models, 360-degree videos, tasks, exercises, simulations, and other interactive activities, all complemented by smart analytics and classroom management apps for teachers.

This doesn't mean that you cannot avail their services as an individual. Their annual subscription costs ₹5,999 and comes with a VR Headset and a controller. While the devices available with the school-level plan

contain displays and are mainly controlled by the teachers, the individual device works just like any other Google cardboard offering. Head to www.veative.com to learn more.

CULTUREALLEY

Every year, a large number of people in our country try to learn one particular language – English. But in a country with as many ethnicities and regional languages like India, a single approach towards the language does not work. The HelloEnglish app from CultureAl-

Big Talk simulates a VR public speaking experience

ley aims to bridge that gap by providing a free, language-specific tailor-made learning experience for everyone. Be it Bengali, Hindi, Assamese, Nepalese or almost any of the multitude of languages spoken around India. HelloEnglish allows you to choose your root before starting the course, as well as your reason for learning English (better job, better social life, etc).

However, rather than providing a boring, routine course-like approach, the platform offers a gamified experience in learning the language where you get 'games' for each lesson you take. With these games you earn coins as well as improve your rank. We started off at a rank of 2.91 crore in the Hindi to English section, so there's no doubt that the platform is popular. On top of that, the platform also offers premium services like interview preparation courses, and resume editing services. There are also in-app purchases to unlock all lessons. <http://new.culturealley.com>

HAPPYMONGO

A relatively new startup in the edutech scene, HappyMongo (www.happymongo.com) aims to 'strengthen the roots' for applying virtual reality and augmented reality in innovative ways. Their main offerings are personality, aptitude and language development programmes for children and adults alike. They have multiple offerings across platforms – web, smartphone

and, interestingly, printed workbooks. Doodles, their augmented reality offering for kids, allows a child to fill colours into a proprietary colouring book (which comes as a complete set priced at ₹599 on Amazon, or even smaller packages). Once the colouring is complete, the child can scan the page on the companion mobile app to watch the figure come alive – with animations and sound. This adds a new layer to a child's conventional learning experience from a colouring book.

Blossoms is a self learning package that improves listening, speaking, reading, writing skills, math, and GK skills through a series of interactive content on workbooks, web and mobile apps. The learning is carried out through episodic stories that also tie into the worksheets.

Big Talk is a VR app that helps develop public speaking skills. It simulates an audience for you to talk to, regarding your sales pitch, your classroom presentation and any other public speaking situation. They also offer a Google Cardboard based HappyMongo VR headset to go with it.
