A COLLECTION OF PRO TIPS FOR EVERYTHING. Without being limited to a particular topic, these tips are from popular software, to coding, to browsers, search, storage rules, password rules, mobile device hacks, bios cracking, tweaks explained and everything tech under the sun.

The art of mastering social media graphics

Creating social media graphics has never been this easy.

SOCIAL MEDIA IS A BIG DEAL, PERIOD. Almost every business worth its dime needs to have a social media presence today. Don't believe us? Check out OUTRAGEOUS or UNEXPECTED's social media page. And apart from the engagement, as in the actual socialising, a big component of that presence is the content you put out on social media - images, videos and more. There are quite a few handy tools for your computer and your phone that can help you master that. Here are a some of those tools and how you can use them like a pro!

USE CANVA

One of the most

useful web-based tools for social media graphics, the best thing about Canva is how much you can do on it for free. From preconfigured templates for all social media needs to an almost inexhaustible stock of elements ranging from illustrations to icons - if you're a social media executive of any level the usefulness of Canva is not lost on anyone. But even within this uber-useful platform, there are few tricks you can use to get the most out of it.

MOVE ELEMENTS BY INCREMENTAL AMOUNTS

Like most image based editing tools today, Canva provides the ability to move elements around on your

The alignment grids help you get the perfect arrangement

canvas using keyboard arrow keys, once they are selected. But that is by a measly 1px at a time and that can be frustrating, even if you're going for an exact alignment. Without losing the convenience of using the keyboard, you can use the shift+arrow keys to move objects around by 10px at a time.

GROUP ELEMENTS WITHOUT CREATING A SELECTION BOX

In a design, you might

have the need to maintain the alignment of certain elements with respect to each other, yet move them around on the canvas. One way to do that is to use the mouse cursor to create a selection box around objects but that can be inconvenient if the objects are far apart and there are other elements in between that you do not want to include. Use shift+click to group objects together and move them. This works the same way as you'd find in professional editing tools.
