

Bethesda's Creation Club

Video game publisher Bethesda's new Creation Club is finally live and people aren't too happy about it. <http://dgit.in/BethesdaCC>

Slack rises to \$5.1 billion

Slack has raised another huge new round of financing that values the company at more than \$5 billion, this time led by Softbank. <http://dgit.in/Slack5B>

02 ADOBE PREMIERE CLIP

To get started with Adobe Premiere Clip, you need to have an Adobe account, which is free and can be created from the app itself. Once you're signed in, start off your first video by tapping on the '+' icon on the project page to select your clips. You can import files from your phone, capture a new video, or pick one from Lightroom, Adobe Creative Cloud or other cloud services that you might be using. Once you have added them, the app offers two editing modes—Automatic and Freeform. The Automatic mode is pretty similar to Quik, whereas, if you select Freeform, here's everything you need to do –

- First, rearrange the clips in the order you desire by simply touch-dragging.
- Then, use the seek bar to trim your clips to select their starting and ending point.
- To add special details to your video or apply colour filters, tap on the 'looks' icon located at the top. You can adjust the colour balance and look of your

video from a list of about 30 different presets.

- Add different transition effects between clips, watermarks or photo motion from the settings menu located at the top.
- Select the music icon to add music or recorded audio from your local memory.
- Clip options allow you to adjust exposure, highlights or shadows of the video, control the sound playback speed or duplicate clips so you can use them again or even split them up.
- Add text titles your video by tapping on the '+' and selecting the 'Aa Test Title' icon.
- Use the Export button on top to save it to your device or upload them to a cloud storage.

Another advantage of using Adobe Premiere Clip is that it can sync with Adobe Premiere Pro, so you can easily continue your project on your PC.

[Note: Most editing applications work in the same way, so if you learn to operate one, it shouldn't be any difficult to work on another.]

03 POWERDIRECTOR & ACTIONDIRECTOR

Irrespective of whether you're a first-time user or someone who is well-versed with professional editing software, PowerDirector by Cyberlink is not only easy to operate, but also provides rich features and lots of customisation. With 4K editing support, the only downside seems to be the freemium model of the app. The free version also

adds a watermark that you cannot remove unless you pay for the premium version.

ActionDirector is much easier to use than CyberLink, good enough for the basics like trimming, adding music, text, color grading, etc. However, it follows the same freemium model as CyberLink PowerDirector.

04 FLIMORAGO

Much like GoPro Quik, FlimoraGo also works well enough if you're just looking for something simple. It has most of the common editing tools and also includes a few extra features like adding subtitles, voice overs, instant share, etc. The most impressive thing about the app is that it is free and does

not feature any ads. The app also does not add any watermark. However, it will add a tiny clip at the end of your video which you can easily trim out using another app. FlimoraGo also has an internal store where you can buy several effects and filters.

Editing videos on smartphones has never been easier thanks to all these powerful apps. Whether you're trying to make a simple family album, creating a memory clip for your friends or

even thinking of starting a new vlogging channel on YouTube, you can do all that with just your smartphone by taking advantage of these applications.
