SpaceX released a video titled "How Not to Land an Orbital Booster" showcasing all of their rocket fails so far. Watch it here: <http://digit.in/SpaceFail>

Corsair Scimitar Pro RGB vs. SteelSeries Rival 500

Want your MOBA gaming experience to run on steroids? We pit two gaming mice against each other to help you decide.

Y

our mouse certainly determines whether you're going to have a pleasant gaming experience or a

frustrating one. This experience depends on several physical aspects such as your hand size and preferred grip style, and hardware aspects such as sensor accuracy and shape of the mouse. If you're a competitive gamer, the genre of game you're playing also becomes a factor before you pick a mouse to play games. FPS games demand sensor accuracy whereas you can do away with MOBA games using mice with average sensors. Extra buttons act as an advantage when playing MOBA games, allowing gamers to assign macros and binds to them. This genre requires a lot of repetitive steps, hence converting them into macros makes things easier by giving the players an advantage to quickly execute them. FPS games also have

binds that can serve as an advantage but for competitive gamers, the generally low sensor accuracy on such mice is a deal breaker.

We've received very few MOBA-centric mice and among them, we are comparing two of the best. The Corsair Scimitar Pro RGB has a wonderful build quality and a staggering number pad of 10 buttons. On the other hand, we have the SteelSeries Rival 500 which has a great ergonomic design and a motor inside for vibration.

FEATURES

Corsair Scimitar Pro RGB

The mouse has 10 buttons on the num-pad, excluding the right and left click, scroll wheel and two CPI buttons. RGB lighting zones are distributed over four zones including the extra buttons, Corsair logo, scroll wheel and DPI level indicator. All the lighting effects and mouse settings can be changed using the Corsair Utility Engine (CUE) soft-

ware. The CPI levels can be switched using the two buttons at the middle. Using the software, they can be reassigned to change profiles. One helpful feature is the adjustable position of the extra buttons that can be changed using a hex key. The PMW3367 optical sensor on the mouse can achieve a maximum of 16,000 CPI. You can scroll through five CPI levels using the CPI switches. The mouse can store three different profiles that can be edited and uploaded from the software.

SteelSeries Rival 500

The Rival 500 has 9 extra buttons other than the right and left click, scroll wheel (which has tilt clicks as well), and the single CPI button. Those extra buttons consist of two flick buttons at the bottom edge on the left side of the mouse which are quite convenient. They can be easily locked down to prevent accidental clicks. The scroll wheel and SteelSeries logo on the palm
