

Nike's new Flyleather

The company's new Flyleather sneakers are entirely made out of recycled leather in collaboration with British E-Leather. <http://dgit.in/Flyleather>

No updates for Battleborn

Launched just last year in May, Battleborn's creative director already seems to have pulled the plug. But servers remain active. <http://dgit.in/battleborn2>

area light up in RGB. You can change the lighting effects, define macros, change key assignments, and much more using the SteelSeries Engine 3 software. The PMW3360 optical sensor on the mouse is capable of reaching 16,000 CPI. Sadly, there are only two CPI levels and the mouse can store one profile. The best feature of the mouse has to be the vibration sensor onboard that shakes according to in-game events such as health status, headshots and low ammo, which is rarely seen on gaming mice.

BUILD QUALITY

Corsair Scimitar Pro RGB

The Scimitar Pro RGB has a premium feel to it with its matte plastic coating across most of the mouse's body. The 10 extra buttons are coated with a textured and matte finish that gives better grip for your thumb. Accidental presses shouldn't be a problem here since the buttons offer good tactile feedback. There's a textured rubber coating on the right side of the mouse, for your ring and little finger. The scroll wheel is also covered with a textured rubber coating. Although not that distinct but the scroll steps are distinguishable from one another. The right and left clicks are using Omron D2FC-F-7N switches which have a durability of 20 million clicks. The Scimitar Pro RGB weighs 147 g.

SteelSeries Rival 500

The Rival 500 is well built with a matte coating on most of the outer body and rubberised zones on the left and right side. The buttons have a rough plastic texture to avoid slipping while the scroll wheel has a rubber coating. The right and left clicks are using SteelSeries' own micro-switches rated at 30 million clicks. On the inside, the components are divided across three PCBs. One includes the main board, the other houses the LED on the bottom of the mouse, and the third one connects most of the buttons on the top. The build quality on the inside is better on this mouse. It weighs around 129 g.

DESIGN

Corsair Scimitar Pro RGB

The Scimitar Pro RGB can't boast of having the best ergonomic design as it sits between a palm and claw grip. A prominent bump present on the top of the mouse ensures the index finger's knuckle sits right above it. Gamers who have a medium to large sized hands (more than 19 cm in length and 9.5 cm in width), will be able to play with the mouse in the hybrid grip mentioned above. Gamers with smaller hands will find a claw grip more comfortable. This is because of the steep slope and tapering edge at the bottom of the mouse. Because of these sharp curves, it's more uncomfortable for gamers with longer or bigger hands.

SteelSeries Rival 500

Compared to the Scimitar Pro RGB, the Rival 500 has a more ergonomic design. The buttons on the left side have been placed keeping in mind how your thumb rests over it. There are six buttons in that area and you will be able to reach all the buttons with minimal movement of your thumb. It has a slight curve on the right side for your ring and little finger, making it more comfortable. It's almost the same size as the Scimitar Pro RGB, hence it's suited for medium-to-large hands. A claw grip is more favourable for the mouse because of the high bump at the top, which is why a palm grip doesn't feel right.

PERFORMANCE

Corsair Scimitar Pro RGB

We found the accuracy to be decent and didn't come across bad response times. When the mouse was swiped too quickly, it would lose tracking. The polling rate seemed to be inconsistent as we observed anomalies in the smoothness tracking. In real world testing, we couldn't spot any inconsistency and were able to comfortably aim in FPS games as well. The best results from the benchmarks were obtained in the 800 and 1600 CPI levels. The graphs weren't as clean and smooth

as seen on better sensors obviously, but they were consistent through all the CPI levels at the median curves. The software is easy to use and defining macros is a breeze. Since you can store three profiles on the mouse, you can define macros for three different games and toggle between them.

SteelSeries Rival 500

On comparing the scores from real-world tests on both mice, it's really difficult to spot any difference. When it comes to our synthetic benchmarks using the sensor tracking software, the Scimitar Pro RGB was slightly better. There's no acceleration or deceleration issues with the sensor on the Rival 500, but on higher CPI levels we noticed slight angle snapping. The wide Teflon feet on the bottom surely helps in giving a smoother experience while flicking the mouse. Coming to the tactile feedback engine, although it's another sensory feedback, we didn't find any significant advantage to it. The Engine 3 software is easy to use as well and defining macros or remapping keys doesn't require much effort.

CONCLUSION

The Corsair Scimitar Pro RGB and SteelSeries Rival 500 are great mice to play MOBA games. The extra set of buttons on both the mice are certainly an advantage. The tactile feedback engine or the vibration motor is a rare feature in a gaming mouse, but for now it's only a gimmick since there's no advantage to using it. Build quality is almost the same but the Scimitar Pro RGB has slightly better materials and a sturdier frame. Both mice have an ergonomic design but the Rival 500 fares better for a more comfortable shape. Performance is almost the same but if you want to go with numbers, the Scimitar Pro RGB gets a higher score. Considering the MRP of both the devices, the Rival 500 is expensive. However, the price might fluctuate online. Aside from the price of the mice, if you look at the features, build quality and performance, the Scimitar Pro RGB comes ahead of the Rival 500.
