

use case. If you're making a bat-signal for your own room, a pretty standard incandescent bulb backed by silver foil in the cavity should be good, whereas you'll need something much stronger for any outdoor usage. Check out a

detailed tutorial on how to build your own bat-signal here: <http://dgit.in/BatSignal>. On the other hand, try out the tutorial at <http://dgit.in/BatLamp> for a smaller, but more diverse bat-lamp.

04 Make a virtual avatar

Making an avatar is easy – just go to any of the numerous online 'avatar creation/editing' web sites and apps. However, if you want to stand apart from the crowd, there are a few

services that are clear leaders in terms of popularity and customisability. **Bitmoji.com** is one of them, where you can create your avatar in the full RPG-style selection screen, also allows you to use the said Avatar as stickers in many apps. And these are not boring, simple stickers that we are talking about – they are pretty interesting and you should give this a shot if you haven't already! P.S the Bitmoji keyboard allows you to place these very stickers in almost any app.

Momentcam takes this approach one step further by turning your photos themselves into comics and emoticons. Select a picture from your Albums or Facebook photos. You can

then pick one of the backgrounds from thousands available, customize your avatar entirely (hair, glasses, beard and many more) and share it with your friends!

05 Webcam feeds that you can watch for hours

While observing someone without their consent is stuff best reserved for horror movies and crime diaries alike, there are some free live camera feeds on the internet that you just have to watch! These are feeds from around the world that are available to

public and will keep you entertained for hours.

- International space station: <http://dgit.in/ISSHDView>
 - Cats (kittens) - <http://www.apl.tv/kittens.htm>
 - Places on earth - www.earthcam.com
 - Drive Me Insane - www.drivemeinsane.com (Control lights in someone else's home)
- And tonnes more.

But if you want to set up your own live stream, all you need is a durable web-cam and enough bandwidth. Check out this tutorial: <http://dgit.in/UStreamVid> and send us the link of the stream you've set up!

06 Go on a tech powered treasure hunt

It's unlikely that you've ever been on an actual treasure hunt (unless you're a character from an R.L. Stevenson novel), but you might have encountered its party-game version. With tech, you can take the geekiness of any treasure hunt one notch higher.

First, you have to try Geocaching. Either head to geocaching.com or download the app here: <http://dgit.in/GeoAnd> (for Android) or <http://dgit.in/GeoIOS> (for iOS). Geocaching is a platform where interested treasure hunters from around the world use GPS enabled devices to go to the location of a hid-

den cache and try to find it. Once you find it, you sign the logbook inside the cache and put it back, and then share your experience online. The true fun here is being able to find the cache.

But if real world treasure hunts are not your thing, you can even try your hand at online scavenger hunts. FYI if you haven't done this before, an online scavenger is pretty much the same as a real world one – the only difference here is that your clues will lead you to URLs instead of actual locations. You can find some pretty simple but interesting ones with a plain old Google search. Which reminds us, we should do another Crack the Code.

07 Organise a flash mob

Before you start worrying about your two left feet, let us tell you that not all flash mobs are about dancing – even though that is what the internet would have you believe. In fact, the phrase flash mob doesn't
