

ing for fun. If you're one of them, get ready to take that fun up one notch with Codefight. Head over to codefights.com and create a free account. Provide your university and employment info to get access to the leaderboards from your organisation – this way, you get to know who else is on the platform.

Once you're in, there are several options that this platform offers you. You could use it simply for interview

practice, solve challenges provided by other users, or go for the arcade mode for a story-ish coding experience. But the best part is the Head to Head section where you can challenge friends, or even a random codefight user to a timed challenge in your favorite programming language. Also checkout a couple of other modes like coding against a company bot or participating in tournaments!

11 Analyse your Facebook profile

While Facebook itself offers a lot of information about everyone else around you, there's one person where Facebook falls short. No we aren't talking about Mark Zuckerberg, we're talking about someone way more important to you, which is yourself! It would be pretty nice to know more about you from a different perspective, right? And thankfully, there is a way to know more, a lot more, about yourself by analysing your Facebook profile.

Quite a few geeks are aware of Wolfram Alpha and its capabilities. But one of its lesser known features involves searching for a 'facebook report'. Once you connect your account and grant Wolfram Alpha access to

your data, be prepared for some amazing insights into your own life – or your social media life, to be precise.

Things like a word map for your Facebook posts, geographic locations of all your friends and their proximity to the poles, their popularity, and even more detailed stuff like an age vs relationship status graph for your entire friend circle on Facebook. With Wolfram Alpha Pro, you can actually check similar data for your friend, based on whatever they've shared with you.

12 Turn your display into a touchscreen

Touchscreens have been around for a long time now, but not everyone can afford the latest and the greatest. Thankfully, you can pretty much convert just about any screen into a touch screen.

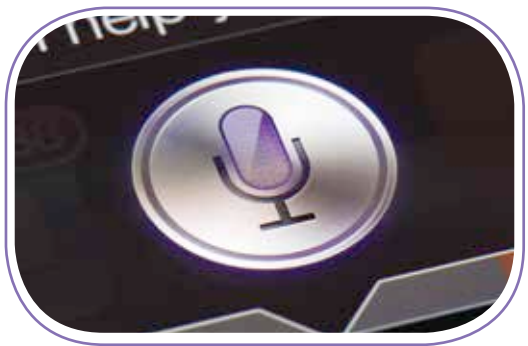

First of all, check out a ready-to-use solution with Airbar (<http://dgit.in/NAirBar>), a very handy laptop accessory that works with Windows as well as Apple laptops. You simply need to plug the device in and start using your laptop's display as a tablet or a smartphone screen.

But if readymade just doesn't cut it for you, check out <http://dgit.in/MonitorTchscrn> for a handy list of workshop tutorials, whereas each one has its own unique approach.

13 Mess around with Google Assistant/Siri/Cortana

Regardless of which platform you're on, it is highly likely that you'll have a

virtual assistant that can take voice commands. And with that, come the many easter eggs that the developers have left in them for you to mess around and have fun with.

For instance, try asking Google Assistant to 'Beatbox' and get your own beatboxing beat to sing along with! Ask Siri if she watches *Game of Thrones* to find out her title in the world of Ice and Fire. And if you've got Cortana by your side, ask her 'Who's your daddy'. Trust us, the answer is hilarious, and true.

14 Have fun with automation

Even though home automation and IoT may not have made significant headway in our country, doesn't mean that you can't have some fun with what's available. Thanks to IFTTT, there are tons of things you can automate for some hilarious results. Get a compatible motion detector and set it up with a cookie jar. Then use <http://dgit.in/WeMoFb> to post a message to Facebook every time somebody digs in.

You could go for simpler ones like posting a silly Starbucks photo every time you connect to their Wi-Fi or even make your own hilarious recipes. Then turn those applets on and watch the fun unfold!
