

We're talking specifically networking stuff. So get your routers and cables in place and make sure the router you've got has enough network ports.

- Of course if you're going for a large scale LAN party that's a whole other ball game. Make sure to tell all participants to have their network cards installed and configured to the right protocol before they get to the party. Always have spare cables! You never know when someone might forget.
- Keep power outages/short circuits in mind. Have extension cords handy and be prepared to tackle any power issues that might pop-up.
- Have furniture! You don't want your buddies sitting on the floor now do you? If you don't have enough, consider renting. Or if you plan to make this a frequent thing, maybe just buy extra tables and chairs.
- Decide on the game(s) being played beforehand, and if everyone has it installed before they get to the party, that's less time spent installing and more time gaming.
- Don't forget to order snacks. Pizza preferably. Or the classic Cheetos and Mountain Dew.
- Have fun!

31 Perform magic tricks with the power of science!

You might think it would take years of practice and extremely nimble and dexterous hands in order to perform magic, but we geeks have it easy.

From setting a note on fire but not damaging it, to turning water into wine. There's a host of magic tricks only us geeks can pull off.

Check out these scientific magic tricks which you can use to blow people's minds. <http://dgit.in/scimagic>

32 Try out an older browser

We haven't always had Google Chrome and Firefox for our browsing needs. Heck, there was a time when even Internet explorer wasn't around to browse the internet! It's a fun exercise to see the internet through the old lenses of old browsers. Even more interesting is to look at modern sites in old browsers. Just head on over to <http://dgit.in/dejavuEm>

and use the old browsers to try and log into your Facebook or Gmail account, and let us know what happens.

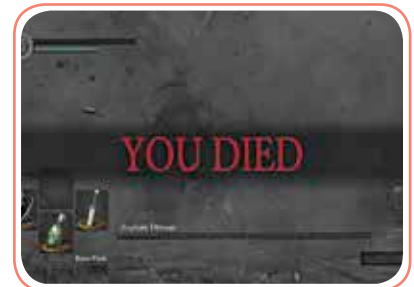

33 Check out what the internet used to like

While we're on the theme of reminiscing about the good old days... or rather the bad old days of the Internet, it's not just browsers that have changed dramatically, it's the sites themselves. We all know what our favourite sites look like now, but what did they look like 10/20 years ago? Take a journey down memory lane by pointing your browser to archive.org and use their WayBackMachine.

34 Pick your favourite game and do a permadeath run

Of course this can only apply to some genres (mostly RPGs), but the idea is to start a new game and you only

have one life. If you die, it's game over. No respawns! So you have to play very, very carefully.

You might have heard of the Pokemon games; they're a great game to try out permadeath on, only this time it's with Pokemon. Basically, if your pokemon loses in combat, you need to release it. So be very careful before getting into battles!

35 Gamify your daily workout!

Working out can be a hassle, especially for us lazy geeks. But not if the fate of the planet de-

pends on you working out, right? Just kidding. We geeks can do anything we put our minds to, if you make it worth our while. And completing quests to defeat alien invaders is worth our while. So is running from zombies in the event of an apocalypse. Here are a few workout apps that make working out a fun ordeal. <http://dgit.in/WoFun>
