Toybox

When you think 3D Printers you don't normally think child's plaything. But that's exactly what the Toybox is, a 3D Printer for children. The Toybox is as simple to use as possible; all it takes is one touch. Your kids can go crazy with their creativity or they can browse from an extensive library of toys that's already available online.

The Toybox comes with apps which allow kids to design and create their own toys, which they can then bring to life using the Toybox. You can store that design on the cloud and even share the design with others.

Toybox promises a "virtually no maintenance" experience. All you will supposedly need to do is replace the printer ink, which

can be purchased from the Toybox store. The print bed, i.e. the surface on which your object will be printed, is bendable, so you can easily remove your object and don't need to pry it off with any sharp objects etc.

We're going to go ahead and assume that this is not for very young children, but it's definitely not limited to kids, adults can have fun with it too.

Toybox is expected to start shipping early next year.

Mighty

When it comes to music streaming these days, the first thing that comes to mind is Spotify. The service has become famous for being one of the best music streaming services out there. Nowadays, you'll find that people no longer download and store music but prefer to go to YouTube or stream music directly from the Internet.

This of course makes your phone the go to device for your music needs on the go, however, there are times when even your phone might seem too bulky to carry along. Be it gyming, jogging or anything really, there are times when even carrying your phone can be a hassle. But we like carrying our music with us regardless.

This is where Mighty comes in. The Mighty is about the size of an iPod, so it's easy to carry or clip-onto your clothes. Furthermore, it can stream your music directly from Spotify and store well over a 1,000 songs on it to play when offline.

Panasonic mini-fridge

Panasonic have come up with a mini fridge which can bring your beer to you! Well, it doesn't have to be beer, it can be whatever beverage you have stored in it. Heck, the fridge will even give you details about every bottle in it. If that wasn't enough, it'll even suggest the best food to accompany your beverage. Now that's a fridge we'd definitely love to have around here in the labs, although it can get quite cluttered around here.

The fridge can supposedly respond to voice commands and move around the house to bring your beverage to you.

The fridge was first seen at IFA 2017 and is still in its concept phase. Make it happen Panasonic! And then send us a review unit.

Apple Watch Series 3

The Apple Watch Series 3 is now official, and the biggest change it brings with it is LTE connectivity. Users will be able to stream music from Apple Music, make calls, and send messages without the need to constantly carry and connect it to an iPhone.

The Apple Watch Series 3 is powered by a dual-core processor and a W2 chip. According to Apple, this makes the Watch 70 percent faster than its predecessors and also makes the Wi-Fi 85 percent faster, while improving upon its battery life by 50 percent.

The Apple Watch Series 3 is the same size as its predecessor (except for the back which has expanded by 0.25mm).

The Apple Watch Series 3 will not need a separate phone number and the company is collaborating with various network providers worldwide to offer cellular services for the Watch Series 3.
