

Okinawa Rush

Okinawa Rush is a 2D platformer/fighting game that's coming out later this year. We spotted it on Kickstarter but the campaign was already over so we thought we'd go ahead and give it a mention here.

Don't let the game's simple pixel art graphics (although they're very well done) fool you, the game has more to it than meets the eye. The game features a parry feature, like in Dark Souls, which if timed well will let you block just about anything. Timing is key though. There's a lot of combos and weapons players will be able to cycle through and the initial response from testers is that the controls are very responsive. Furthermore, the game will have local co-op, so you and your buddies can whoop ass together. There are different playable characters, each with their own back stories and combat styles for players to explore. And of course, boss fights, lots of boss fights. Okinawa Rush is set to release on the PC, PS4, and Xbox One.

BittBoy

We're seeing an influx of retro consoles these days with the NES and SNES Classics (just to name a few) and even Atari making a comeback. But we're not really seeing any love for the retro handhelds. That's where the Bittboy comes in, which is clearly inspired by the GameBoy. At 2.5 by 4 inches, this handheld is tiny, smaller than most smartphones. Basically, it fits in the palm of your hand. But it boasts a library of 300 games built-in to it and controls like GameBoy, so most handheld gamers will be immediately familiar with the controls.

The BittBoy comes with a 500 mAh battery, which doesn't look like much on the surface but it'll last you a long time; you don't have to worry about it dying on you too often while you thoroughly go through the 300 game library.

Then there's the ability to plug it into a TV, something you won't find on retro handhelds. The BittBoy itself ships with a mini stereo RCA AV out.

All that for just \$39.99 (₹2,560) is a great deal but be aware that you can't expand its 300-in-1 library.

Specdrums

Air drums. We've all done it, you don't have to hide it. What if you could actually make some music with those amazing air drumming skills? Though technically in this case it wouldn't be air drumming anymore.

Specdrums are basically rings which can recognise colours. Whenever the rings come in contact with a specific colour, they play the sound associated with that colour. So you could pretty much create your own virtual drumkit, (or keyboard) using Specdrums.

To use the Specdrums, all you need to do is simply connect the rings to the iOS or Android app and then tap on colours that you want to associate with musical sounds or pitches on the app.

There's a lot of instruments to choose, from drum kits to keyboards and synths. While you get a 12-colour keyboard, you can still connect the ring to any colour of your preference. Up to 10 rings can be connected to the app.

Apple TV 4K

Apple was lagging behind in the streaming department but with the new Apple TV 4K, the company is now finally in a position to compete. Apple TV 4K, as the name suggests, supports streaming and playback in 4K resolution. It also adds HDR10 which will make for brighter and more vivid picture quality. Apple TV 4K will also support Dolby Vision, which is essentially a premium form of HDR10.

The Apple TV 4K comes with auto-upgrades to 4K HDR. Users who have purchased HD movies on iTunes will be offered automatic upgrades to 4K on their existing purchases at no extra cost. HDR and 4K titles available on popular streaming services like Netflix will also be viewable on the Apple TV 4K. A new Siri remote will be bundled with the streaming box as well.
