BE LAZY

THIS MONTH IN TECH:

You heard it right, learn how to automate simple tasks on your PC with this month's workshop. Get to know how cryptomining works on websites and take a closer look at the iPhone 8 Plus. Want to know about the best web browser for desktops? We find the answer.

The Bitcoin roller coaster

October has been an eventful month for the world's most popular cryptocurrency, as it went past \$5000 and \$6000 within two weeks, amid speculations of China un-banning cryptocurrencies. At the time of writing this, Bitcoin stands at \$6033. <http://dgit.in/BitRiches>

WHAT'S NEW

Made by Google

October 4th was the day, that will be remembered in the future of Android smartphones as the really special day, when... not much changed. The Made by Google event this month gave us the successors to last year's Pixel range, namely the Pixel 2 and the Pixel 2 XL. The smartphones, boasting of the 'best smartphone camera ever', also brought to us Android Oreo with interesting features like Google Lens built-in. The Portrait Mode was reasonably a talk of the town since Google is doing it with just one camera lens while the others are using two different lenses. But to be fairly honest, we had expected a lot more.. unique stuff from the Pixel phones this year. Well, let's hope third time's the charm.

What did steal the show, however, were the host of other hardware devices announced at the event. Google launched more products in the Google Home range, namely the Google Home Max and the Google Home Mini. While the Home Max is a premium super-sized version of the Google Home smart speaker that boasts of two 4.5 inch woofers as well as tweeters. The Google Home Mini is just the opposite – the Google Home but in a tiny package.

Alongside updates to the existing Home range, Google also launched a couple of new products. While the Pixel buds are mainly targeted to potential Pixel customers (since there's no head-phone jack this time around), the real-time translation feature makes it an interesting device for practically anyone. Because who wouldn't want to speak in a different language without taking the pain of tapping and speaking to their smart-

phones? Also launched was the Google Clips smart camera that uses machine learning to capture photos and videos of interesting stuff going on in its view. Additionally, a premium high-end Chromebook, the Pixelbook, was also launched.

Overall, Google gave the world of tech a lot to talk about this time around, and you need to stay tuned for more details on how well these devices perform.

Windows Phone is officially dead

In a series of tweets, Microsoft's Joe Belfiore has revealed that the Windows Phone will not receive any further hardware and feature updates. However, bug and security fixes will continue to be released in a timely fashion. <http://dgit.in/RIPMSPhone>

Nvidia announce a platform for autonomous cars

NVIDIA claims its new system, codenamed Pegasus, can be used to power Level 5, fully driverless cars without steering wheels, pedals, or mirrors. <http://dgit.in/nvidiapegasus>

New Facebook app only on Android

A new Facebook app/feature that lets users subscribe to publications and content platforms within the app will only be available on Android, thanks to Apple's vehemence to charge 30% of all in-app purchases. <http://dgit.in/NoThnxApple>
