that has gained popularity due to its high payout rate is CryptoLoot (<https://crypto-loot.com/>) which gives out a payout 88% of mined commissions, at specific minimum intervals of 0.3 XMR (Monero).

The visitors to your website can run the miner directly in their web browser and mine XMR for you in exchange for an ad-free experience, in-game currency or whatever incentives you can come up with. Get innovative, and do away with those intrusive ads. Most users won't mind letting you use their CPU for short durations in exchange for an ad free website or some added freebies. Your users can "pay" you with just their CPU power. The best part? They can do that without registering an account anywhere or without installing a browser extension or without being bombarded by ads.

GETTING STARTED WITH COINHIVE

Shortly after the launch of CoinHive, multiple anti-viruses and adblockers started blocking JavaScript from CoinHive's domain due to misuse by some irresponsible parties. Therefore, Coinhive started serving the JavaScripts from a different domain where it made the user's explicit consent compulsory at all times when the script is involved.

Thus, the starting point is very simple. Just like most other JavaScript based libraries go ahead and include it in your page somewhere (ideally at the bottom of the page, just before the start of the ending body tag) like shown

Example of the opt-in screen

here: <http://dgit.in/CHEg1>. Once you've done that, you're ready to move onto the next step.

ADDING A MONERO ACCOUNT TO RECEIVE PAYMENTS

Now create an account on the Coinhive website and go to the settings tab after that is done. Go to the sub-section of Payments and add your Monero wallet address and save it.

If you do not have a Monero wallet then head over to their official site (<https://getmonero.org>) or read (<http://dgit.in/MnreoHw2>) first to get step by step guidelines on how to create one. After receiving the payout in XMR you can head over to <https://changelly.com> for conversion to most popular Cryptocurrencies or normal currencies as well.

ADDING YOUR SITE AND GETTING YOUR KEYS

Again, head over to the settings tab and navigate to the section mentioning "Sites & API Keys" and

- Add the name of your Site.
- Copy the Site-Key and the Secret key in some place safe.
- Save your settings.

Repeat the process if you want to add another site or have multiple analytics for different pages/sections etc. of your site. You can also change your secret key here in case you wish to do so. Now use this site key and secret key wherever mentioned in this article or in the official documentation.

Congratulations, now you are all set to go!

JAVASCRIPT API OPT-IN OVERLAY

When loaded through authedmine.com the JavaScript API will ask the user for consent as soon as `miner.start()` is called. This is done in a popover window directly on your page. You will not be able to start the miner if the user cancels the opt-in.

If the user gives consent, an opt-in token is stored in a cookie on your website. As long as the token does not expire, the miner can start again without a further explicit opt-in.

*CODING MATTERS

*Google releases management API for Android

Google has released a tool that lets you manage Android devices using a server-side API and with no need to write your own management app.
