Plantronics BackBeat 505

Decent, despite notable compromises

The Plantronics BackBeat 505 is one of the more affordable on-ear wireless headphones in the market, so it's only natural that you make a fair share of compromises here. For instance, the plastic headband feels a little flimsy at times, the adjusters are jittery, and the padding is not enough for comfortable wearing.

The neon green-matte grey colour of our review unit may not be universally popular if you're finicky about your accessories, but it looks bright and youthful. The Plantronics BackBeat 505 is very easy to use — buttons are well textured and laid out, pairing the device is quick and simple, and you also get a 3.5mm Aux

port and a microUSB port for wired listening and charging, respectively.

The overall sound is fairly well balanced, although clarity takes an audible hit. The sound is muddled and audibly distorted particularly at

volume levels of 80 percent and above. However, there is ample bass, and the mids are decently pronounced. The highs are a tad diminished, and sound a bit too bright and shrill. The bass notes are not very distinct, but are still acceptable. Soundstaging is not expansive, and the overall sound is a bit constricted.

The best part of the Plantronics BackBeat 505 is its battery life, and we actually clocked nearly 19 hours — almost one hour more than its official rating. At this price, it is fairly commendable, and is worth making the compromises for.

GIGABYTE Z370 AORUS Gaming 7

It's not like you have a choice

With Intel's Coffee Lake, we're seeing more than the usual four cores as the flagship in their mainstream series and the GIGABYTE Z370 AORUS Gaming 7 is one of the few motherboards that can push the new Core i7-8700K to its limits. You have the RGB Fusion platform for all the RGB madness one would like to indulge and the audio is exceptional thanks to the added ESS Sabre 9018 DAC. The board packs in a 10+2 power phase design which really helps with the overlocking and we experienced the same as we pushed the Intel Core i7-8700K all the way to 5.2 GHz on air cooling, at the cost of stability. Scaling down to 5.1 GHz made it stable

There's no questioning the build quality of the board since we seem to have premium components for the entire feature set. Also, DIY enthusiasts get to play around with the board thanks to the swappable LED overlays. Even the rear I/O has a miniature cooling fan under the

plastic shroud providing the VRM chokes with some much needed cooling. We did have some issues with

the F3 version of the BIOS when switching memory frequencies, however, the same was resolved when we tried out the F4 BIOS. Since you're stuck with the Z370 chipset until Q1 2018, we'd say that the Z370 AORUS Gaming 7 is a pretty great board for the new platform.
