

Inverted ice canyons??

Scientists have found inverted ice canyons under the Antarctic which is speeding up the melting of the ice <http://digit.in/invertice>

Gene therapy for blindness

A new gene therapy may soon be approved to treat a rare genetic form of vision loss and blindness <http://digit.in/GeneBlind>

THE BROWSER STRIKES BACK

Several web browsers have been fighting for the top spot but only one shall rule.

Y

our web browser is easily the most used application on your desktop or laptop.

From browsing social media to watching the latest episode of your favourite TV show, to checking your emails and even shopping online, you're probably clicking and scrolling on the web browser all day.

Currently, a few web browser engines or web rendering engines exist. They form the basic component of a web browser to render webpages in a readable format. The most popular ones include WebKit, Gecko and Trident. The Chromium Project is based on WebKit which is still used on Apple's Safari browser that was discontinued on Windows. In 2013, Chromium made the shift to Blink which is actually a fork of WebKit. Earlier, Opera used the Presto engine

but eventually they also moved to Blink. Vivaldi, co-founded by Opera's ex-CEO is also based on Blink. Veteran web browser Internet Explorer is based on the Trident engine and it was forked to create EdgeHTML on which Microsoft Edge is now based. Gecko is the oldest engine which has been used by Firefox since its inception. Now, Mozilla will start migrating to Servo in their upcoming version of Firefox.

We compared six web browsers running on Windows 10 including Google Chrome, Internet Explorer, Microsoft Edge, Mozilla Firefox, Opera, and Vivaldi. The goal was to find the best browser available for free on Windows that gave us the best overall experience of accessing the Internet. This test was carried out on a desktop system. Before you read any further have a look at the How we tested box to understand our testing methodology.

GOOGLE CHROME

Google Chrome's launch took the web browser market by storm as it rapidly gained popularity. It not only looked futuristic but every update from them had something refreshing. At that time, they were the only ones with rapid update cycles, and they just kept adding more features. Chrome blows away the competition when it comes to performance. Although Opera and Vivaldi have almost the same score in synthetic benchmarks, Chrome manages to make the extra cut in our real-world testing. There weren't any visible lags during any of the benchmarks, nor did any of the browsers crash. The tests confirmed that Chrome has the best support for HTML5 elements on websites by achieving the highest score of 528 out of 555 (the perfect score for the HTML5 test). This test was carried out on a
