

What is a wormhole?

A theoretical passage through space-time that can cut short long journeys across the universe. <https://www.space.com/20881-wormholes.html>

A trip to Mars

The fastest spacecraft launched from Earth can reach Mars in approximately 3888 hours on average time. That's 162 days. <http://digit.in/get2mars>

tabs, CPU utilisation lingered around 20 per cent, without even any interaction with the webpages – in contrast, other browsers would drop to less than five per cent CPU usage. It doesn't kill your CPU, but it will constantly run it slightly higher than other browsers.

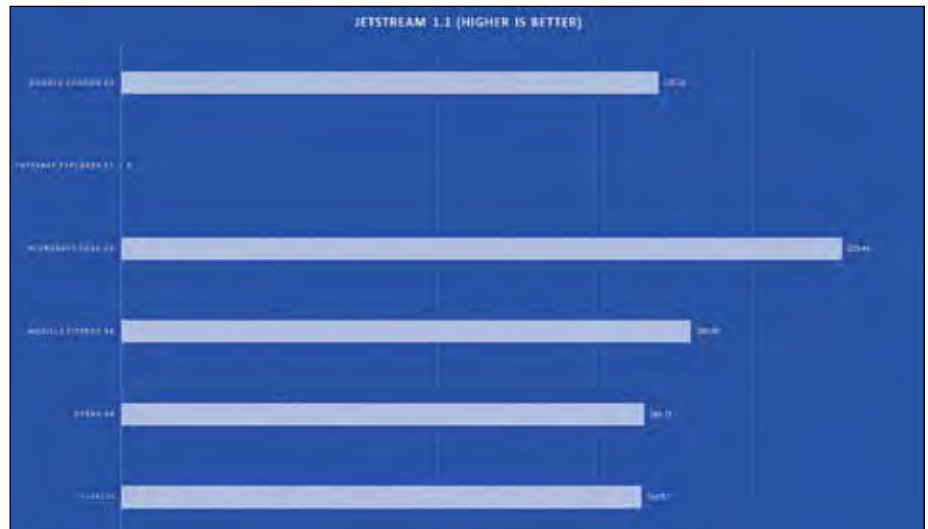

There just aren't any pros to using Internet Explorer, except that it's fast and the user interface is clean. Sadly, it's true that IE is relegated to be the browser most people use to download another browser on the first run of a PC!

There's hardly any support for extensions, which is a deal-breaker these days. It does consume the least amount of RAM amongst all the browsers, but then again, it's probably loading the least scripts and throwing up the most background errors. You can choose to use this if you're feeling a little retro, but we certainly wouldn't recommend it.

MICROSOFT EDGE

Microsoft has been trying really hard to push Edge on Windows 10 by using pop-ups to remind you to try it out, and prompting to use it as your default web browser. Even updating Windows usually resets all your default applications, and Edge returns as your default browser! Very irritating.

That niggle apart, Edge is a sleek browser that takes advantage of Windows' Modern UI. It performs well on synthetic benchmarks indicating EdgeHTML's performance bump from Trident v7 (the older engine of Internet Explorer). However, during the MotionMark test, the tab froze for a few seconds and gave a "webpage not responding" warning four times. This happened whenever there were too many graphical elements on the screen. It lags behind the competition (excluding IE obviously) in all the benchmarks except JetStream.

This indicates that Edge has a better JavaScript engine than the rest. But its RoboHornet score is lower than even IE and hence, you won't have the same performance and experience of using tables in Spreadsheets or viewing animated GIFs.

Speaking of real-world testing, Edge has terrible memory management once it crosses more than two or more tabs. Overall, the new browser from Microsoft still has a lot of work to do. It still is a good enough browser to scroll through social media and reading articles on the web. The user interface is simple and easy to navigate. The extension library is small comparatively but you should be able to find the bare necessities in the Windows

Store. Another unique and native feature that Edge includes is the ability to annotate over webpage screenshots. We'd still expect you to use a different browser as your default though.

MOZILLA FIREFOX

After the launch of Google Chrome, Firefox started falling behind in terms of features and speed. Looking at the benchmarks, it's clear that it has to do with the ancient Gecko web engine that Firefox has been using since it was first developed. Newer browsers that have jumped onto the Blink engine performed better than Firefox. Although Gecko seems to have a slightly better JavaScript engine than Blink, it scores lower in other aspects. Page load times
