

Self Driving Cooler

Honda has revealed a self-driving cooler, inspired by the Sports EV concept car unveiled earlier this year <http://digit.in/SelfDrvrngClr>

Saudi to invest billion in Virgin

Saudi Arabia to invest 1 billion in Virgin Group's space companies, including Virgin Galactic, the space tourism outfit <http://digit.in/SaudiVrgn>

VIVALDI

If we had an award for the best looking web browser, Vivaldi would have definitely won that. This newly launched web browser is gaining a lot of attention because it offers customisation like no one else. Usually, you are restricted to the universal user interface shipped by the developer. Vivaldi is offering its users the ability to change the interface including the layout, colours while adding mouse gestures. Since the browser is based on Blink, the performance is similar to what we see on Chrome. In fact, it scored the highest in MotionMark and had the least CPU utilisation. Page load times were decent and quite close to Chrome's numbers. We don't have anything to complain about its performance.

Coming to the features, it does offers a lot on the visual front but is still lacking on the useful ones. The number of options visible on opening the Settings menu is overwhelming. There are tiny features such as an in-built note-taking tool and an innovative tab stacking feature that lets you group tabs to avoid a mess of opened tabs. It's too early to say how the browser might turn out to be in the future. If you're bored of navigating the user interface of your current browser, and want to use something which is bright and lively, you should definitely give Vivaldi a go.

BEST PERFORMER

Looking at the final scores, it's clear that the Blink engine provides the best performance until now. So, if you're planning on developing a web browser of your own, you should definitely use Blink. Browsers based on Blink including Chrome, Opera, and Vivaldi received the highest scores in synthetic benchmarks. The scores differed only by decimal places. But Opera and Vivaldi took a hit during our real-world testing, which is where Chrome

excelled. With the lowest page load times, best HTML5 and WebGL support, and surprisingly low consumption of RAM given its reputation in the same, Google Chrome easily takes away the Best Performer award.

BEST WEB BROWSER

You might have already predicted the winner of this comparison right since the beginning. We were certain that this particular browser might win by a huge margin, but we were wrong. Although Opera was highest in terms of features, it took a hit because of its lower performance. Chrome's big numbers on performance, especially in real-world tests, and a balance of the essential features, deserves the top spot of being the Best Web Browser.

EDITOR'S PICK

Using Chrome for more than half a decade, we have become used to its simple and fast user interface. Once you venture out to try the others, you will realise that you might be missing some essential features. Since the time we started using Firefox Quantum, we've been impressed about how it looks, the features it provides, and its performance while browsing. Being in beta, it's extremely buggy and sometimes our PC just froze and stopped responding. For an overall comfortable and productive usage, we found ourselves using Opera mostly, which receives the Editor's Pick. However, this is completely subjective. If we had an inclination towards looks over function, we are pretty sure that we would have picked Vivaldi instead. **d**
