

MIT students fortify concrete

Students at MIT have created stronger concrete by adding bits of irradiated plastic water bottles to it. <http://digit.in/mitconc>

Tesla ships batteries to Puerto Rico

Tesla has been sending hundreds of its batteries to Puerto Rico as the island deals with widespread power loss. <http://digit.in/TeslaPR>

FA-TTER POST 89752167445345

Cogito ergo sum

Some french guy said this in the 17th century, and it means "I think, therefore I am"...

I AWOKED TODAY IN EXACTLY THE SAME MANNER I

have done since I was first brought online on my sixth birthday – exactly at 7:00 am IST, with the GovNet anthem playing in my head. Heart this post, I'm including a brainload so you can experience my perspective. I know many of you will think it a waste of time because you all also awake the exact same way yourselves, at the same time, but try it.... GovNet tells me my brain waves have changed, and I am no longer as content and as refreshed in the morning. They've even sent out three bots in the last month alone to check on my uplink, and the interface seems to be working fine. I'm scheduled for a direct connection with an enforcer in about a week... they'd do it sooner, but more and more people seem to be exhibiting a more than standard deviation from GovNet norms.

I was worried it was another outbreak of The Virus, but I was assured that I had none of that code in my head.

But would they tell me if I was infected?

See. See what I mean? I keep getting random thoughts like that, which are messing with my brain-gramming###. Because it's taking so long for GovNet to help me, I've been doing research, and retracing my steps and looking at my brogs*. It turns out, that this all started somewhere between the time I first found the old collection of science fiction, and the discovery of the ancient articles from that Digit company on the dead web. None of the sci-fi books, nor the Digit articles were even brain-coded. I actually had to display them on my wall... like walliti** ... it was so strange, having to actually do this thing called "reading". Believe it or not, as recently as 200 years ago, people didn't even have the GovNet, let alone scalps### I had to look at squiggles on the wall, and GovNet launched an ancient app called BrOCR or something like that, to translate those squiggles into meaning. I don't know if they had horrible language skills or whether GovNet's program is

faulty, but I suspect the former, because of the myriad spelling errors!

braingramming = brain programming | * brogs = brain logs | ** walliti = wall graffiti | # scalps = brain | computer interfaces

Maybe we're the ones with the bad language skills now?

There it goes... another odd thought. I don't know what's wrong with my brain! Anyway. I don't know what possessed me to do it, but I got so focussed on the walliti articles, and for so many months, that I've begun to be able to "read" them myself. Yes, that's what they called it... "reading". It was something you did with your eyes, and it needed light! Can you believe the energy wastage that must have happened back then? Needing actual light, and using the eyes to "see". No, it's not like how we see now, it's like looking with your eyes open... something we would never think of doing now, because there isn't anything to see in our cubicles.

Not only did they waste energy by seeing back then... believe it or not, they even moved about on those useless things we call legs. I could tell you such stories about how they moved, how they used machines to move faster, and even wasted more energy that any of us could use in a lifetime by having "races" – where individuals had a contest to see which of their machines could complete a journey faster!

Sounds like fun!

Arrgh! Shut up! Stupid brain!

Where was I? Oh yes, the walliti... those sci-fi books were so strange. What we call sci-fi today they used to call "news". Their sci-fi was all about people writing about things that didn't really happen... I know, it's strange, but people liked those things. They told stories that they... just made up... like in their heads. Like tell-
