Android's Saviour

Project Treble could very well be Android's dark horse in the smartphone OS race

Sudhanshu Agarwal | feedback@digit.in

A

ndroid's Achilles' heel for many years has been slow and insufficient software updates. Even major

Android manufacturers such as Samsung struggle to deliver updates on time even to the flagship device. Waiting for an Android update is like waiting in a queue to get a burger. You know you will get it. You cannot wait to taste it, and the restaurant takes forever to make it. More than waiting for updates, budget segment devices rarely receive software updates. Motorola was once a shining beacon of light when it came to software updates. The original Moto G was revolutionary, and one of its selling points was software support for two years. The current generation Moto G will receive only one major Android update. The device is an ideal example of a mid-range smartphone loaded with

tons of features but no OS updates.

Google tried to fix this by making rival phones with on-time updates, but even Google couldn't always deliver updates on time. It is no surprise that Apple still rules the flagship space. With its on-time updates and a record of supporting devices for years, customers get the most bang for their buck when it comes to software support. Google wants to change this with Android Oreo.

ANDROID OREO'S SECRET SAUCE

Android Oreo is a massive leap for Android with under the hood improvements, but none of the changes are

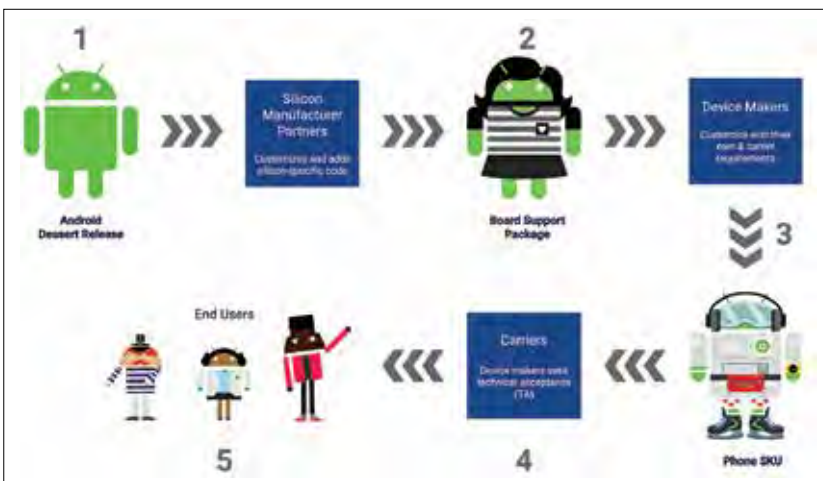

more important than Project Treble.

What does it do? To release a new update to a device, a manufacturer has to go through many steps. Most Android manufacturers do not make their own chips, and hence have to depend on the chipset manufacturers to release updates on time, and Project Treble is trying to fix the delay in software updates caused by the silicon manufacturers and their delayed updates.

When Google releases a new version of Android, the chipset manufacturer modifies the chipset vendor implementation to a more modern version to ensure that their chipset still works with Android. Then the device manufacturers edit the new version of Android to make it unique. Samsung integrates the Smart UX, and Xiaomi adds the MIUI. Changing the UI is the most time-consuming aspect of releasing an update, and this is where manufacturers try to differentiate themselves from a ton of devices that exist in the Android sphere.

ANDROID > IPHONE?

Android flagships can go head-on with an iPhone when it comes to hardware. Android flagships have bezel-less displays without an awkward notch on their displays. Android phones can beat any iPhone when it comes to

Behind the scene after a new version of Android is released
