

THIS IS TECHNOLOGY, CULTURE AND SCIENCE WITH A DIFFERENCE, AND THAT DIFFERENCE IS USUALLY ENOUGH TO MAKE MOST NORMAL PEOPLE GO "WTF?"

Visual Story

WHAT KIND OF A GEEK ARE YOU?

This time around we take you on a complicated visual journey to discover what kind of a geek you are. Page 106

Apple's Face ID is easy to spoof

A new video from FaceTec, a security company pushing out their own facial recognition app, shows that the iPhone X's Face ID unlock system is apparently quite easy to fool. In the video, Face ID was successfully fooled by paper-eyes printed out and placed on the owner's face, as well as various pizza toppings.

WHAT'S NEW

The Amish gene that protects from diabetes

It has been discovered that the Amish people (they're a people who live disconnected from the rest of the world and live lives independent of modern technology) have a rare genetic mutation which protects them from Type 2 diabetes. The gene has helped increase their life spans as well.

The gene causes them to produce unusually low levels of PAI-1, which is responsible for functions like clotting and aging of our bodies. Scientists have long suspected that it has other functions.

The findings were published in the Science Advances journal. The discovery also has experts

looking into the processes of underlying cellular aging and how this can be used to find new therapies for chronic diseases.

The world's first (possibly) images of dogs

In the Arabian Desert, carved into a sandstone cliff, you will find the image of a hunter with his bow drawn, getting ready for the kill. But that's not what we're interested in. It's the 13 dogs accompanying the hunter, each with their own unique markings. Two of them even have lines running from their necks to the man's waist. Could these be leashes used to rein in the dogs? If so, what we're looking at

could be the earliest depiction yet of man domesticating dogs. The engravings date back more than 8000 years, which suggests that humans may have mas-

tered the art of taming and domesticating dogs thousands of years earlier than what was initially thought.

However, it should be noted that more work and research will be needed to confirm the meaning and depiction of the carvings for sure. But if confirmed, it would be another indicator of just how deeply domesticated the species of dogs are.

Sheep can recognise faces

According to a new research by scientists at the University of Cambridge, Sheep can be trained to recognise human faces. Their facial recognition abilities are comparable to those of humans and monkeys according to Professor Jenny Morton, who led the study.

YouTube flagged a Google ad

In an ironic turn of events, YouTube's algorithm for flagging videos which has been taking videos down and demonetizing them for no reason, ended up flagging Google's own Chromebook Pixel ad as spam. A taste of one's own medicine eh?

Noise-cancelling fork

Otohiko is a noise cancelling fork, that looks something like an electric toothbrush. It works by emitting loud electronic noises that sound like a combination of waves and futuristic space sounds to drown out the sounds of slurping. Is this for real?
