A COLLECTION OF PRO TIPS FOR EVERYTHING. Without being limited to a particular topic, these tips are from popular software, to coding, to browsers, search, storage rules, password rules, mobile device hacks, bios cracking, tweaks explained and everything tech under the sun.

Pro-tips for everyday gadgets and applications

These assorted hacks, ranging from the iPhone X to Gmail, will show you how to use your favourite day-to-day tech like a true geek

PLAY YOUTUBE MUSIC IN THE BACKGROUND

Without a subscription to any music streaming service, you might be reliant on YouTube for your daily music. But the mobile app is limited and won't play the audio in the background. In order to bypass this, open up YouTube in the Chrome web browser in your Android phone. Tap on the browser on the top right menu and select "Request desktop site". Now, start playing a song and tap on your phone's Home button. The song will continue playing in the background.

DEACTIVATE FACEID ON IPHONE X INSTANTLY

While the FaceID on the iPhone X might be a huge convenience for all its users, allowing them to unlock the phone with just a glance, there might be situations where you do not want it to work. For instance, in a situation where you've been forced to unlock it, you'd want a way to disable it. And that can be done quite easily – just press the power ("side") button five times quickly to disable FaceID. It does get enabled once again after you unlock via PIN/passcode.

IDENTIFY SONGS INSTANTLY ON PIXEL 2

One of the most interesting features on the Pixel 2 might have been lost in the

debate about the screen quality and praise about the camera. Your Pixel 2 can actually identify any songs playing around you at any point of time and display the name on your lock screen. To enable this, go to Settings>Sound>Advanced and scroll all the way to the bottom to find Now Playing. Inside this menu, enable the toggle 'Show on lock screen' to enable this feature.

EDITING AUTOFILL INFORMATION ON IOS

As many iOS users would

know, iOS has a system-wide autofill feature. That means, that any information that iOS has synced about you, it will fill on any forms across the system

by default. That can be a bit irritating, especially since it doesn't exactly check with you before syncing the information. To edit the information, go to the Contacts app and tap on My Card at the top. This shows you all the information that Siri has read about you from across the system, along with where it has been read from. To make iOS ignore a particular piece of information, say, your email ID, simply tap on the information and tap on Ignore. But in case you want to edit it, you'll have to go to the app
