

Jeff Bezos' net worth over 100bil

After the Black Friday stock surge, Amazon CEO

Jeff Bezos' net worth tipped over \$100 billion.

<http://dgit.in/jeffBez100b>

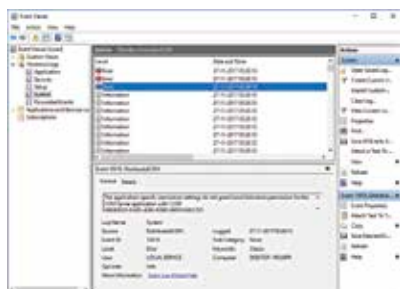

my computer desk rebuilt with a few extra compartments which I can repurpose for integrating my computer into them. If I don't get enough time for that then I'm all down to grab a couple of aluminium sheets, have it machined

and screw them together to build my own case. And if I'm too damn lazy to do that either, then I might just admit defeat and get a Crystal 570X or a Masterbox. I'm open to suggestions, what do you guys think I should do? **[1]**

BUYING ADVICE

RANDOM RESTARTS

Q Hey Digit, I'm facing a really irritating problem. I just bought a new PC and installed genuine Windows 10 on it. But my machine just randomly restarts without any

Event Viewer to the rescue

warning whatsoever. I Googled to find a solution but that didn't help much since most solutions were just repetitions. Or maybe I'm not Googling the right term. Through one of the solutions, I managed to figure out what was causing the restarts – it's an error due to DistributedCOM and has an Event ID of 10016. Help me out, I don't want my hard drives to get corrupted with these random restarts.

—Pankaj Kumar

A Hey Pankaj, I can understand your problem because I faced the exact same thing recently. The trouble with any error code is that though it has a very simple explanation, the cause could be something entirely different. In your case, you should start off with the event viewer log which will tell you that the COM server application with a certain CLSID didn't get the right permission to execute locally. Thankfully, someone has

chronicled that in great detail over here – <http://dgit.in/DCOM10016>. In my case, the culprit wasn't the DCOM issue, it was an older BIOS which had a cascading effect that lit up the DCOM service and was an absolute pain to troubleshoot. Here's to hoping your issue is much simpler.

WHY 520?

Q Hey, I just read Digit's review of the Lenovo Legion Y520 gaming laptop. I was planning on buying that but I saw software issue as your cons, can you elaborate on that issue? What exactly is this software issue all about? Any help would be appreciated.

—Prasad Bhavesh

A The thing is, the Lenovo Y520 locks the Windows key when in game, which is a good thing, but if you press it accidentally, the Windows key occasionally locks itself in the on state. Just the same way it would if you pressed Windows key + X. This means, after you

Lenovo Legion Y520

accidentally pressed the Windows key, pressing just Q opens Cortana, or if you press E for instance, a new explorer window will open, and so on. It happened to me during Dota 2 and I can tell you it was way more infuriating than the slight heating issue the machine has. However, this issue was not consistent, but still happened enough times to get a mention in the review itself. **[1]**
