W

hile you can start gaming on any third-party cards, it's best to install the

accompanying software to make the most of it. With ASUS graphics cards, that particular software is GPU Tweak II. The ROG STRIX GTX 1070 Ti has multiple modes, the default 1070 Ti clock is what ASUS calls Gaming Mode, then there is an OC mode where the card ramps up to 1759 MHz and if you want a bit of silent operation, they have the Silent Mode which underclocks the card to 1581 MHz. The fan speed curve seems to be the same across all modes, so the silent mode is all about the lower clock speed.

When it comes to the performance, the card scores about 310 points higher in 3DMark Firestrike and in Rise of the Tomb Raider running on 4K at ultra settings, it scores 43 FPS. Considering that the standard GTX 1070 Ti gives 41-42 FPS, the OC didn't exactly make a huge difference. And then there's the cooling, which consists of a triple fan setup that kicks in at 55.26 degrees and then ramps up to about 40% at 67.42 degrees. Running Furmark with the default fan curve didn't make that big a noise as the Founders Edition did, so that's where the value lies in getting one of these third-party cards. The street price difference is huge for this advantage, a Founders Card sells for 39K while this particular can cost you around 47-49K. Which means you're paying quite the premium for the third-party cooler and we're certain that it's worth the money.

Motorola Moto X4 4GB

Are you a sucker for compact phones?

A

5.2 inch screen on the Moto X4 with a Galaxy Note 8 like curved glass back (Gorilla Glass 3) makes for a truly compact smartphone. The Moto X4 doesn't feel flimsy or breakable. The display brings impressive contrast and colours, and though they don't particularly "pop", it's a pleasant experience. It's adequately bright and 1080p works without fail alongside the 5.2 inch size. The display is also good to touch and resistant to fingerprints. Given that it has a SD630, Motorola may have a hard time explaining why the Moto X4 should make any sense over the G5S Plus and G5 Plus. With the Moto X4's camera, the company took a shot at LG's method, combining a 12MP sensor alongside another 8MP wide angle sensor. Wide angle here is an actual wide angle lens, unlike on the telephoto plus wide angle combos. Motorola offers 120 degree field of view on the secondary camera. Everything considered, the Moto X4's camera really doesn't belong in the 20k price segment. There are plenty of phones with better cameras, including the Xiaomi Mi A1, Moto G5 Plus, Moto G5S Plus and Samsung Galaxy J7 Pro. The Moto X4 has a good display, just enough battery life and dependable performance. For compact phone lovers, the Samsung Galaxy J7 Pro offers more value for money.
