Samsung T5 External SSD

V-NAND on the go

There's always the need for more data storage, no matter what the situation is. Before smartphone storage hit 32 / 64 GB, most of us still carried around a separate thumb drive, and if we wanted more space, then we'd carry an external drive. However, those bulky things hardly fit in your pocket so you'd have to spend more money to get the more expensive thumb drives. External SSDs are perfect for such scenarios since you get a lot of storage in a small form factor. And given that this is an SSD, you can take the added benefit of really fast speeds.

The Samsung T5 external SSD comes in a really swanky form fac-

tor which is just 5.7 cms wide and 7.4 cms tall. It's smaller than most mobile in the market right now and packs in up to 2 TB of space.

In our benchmarks, we managed to get 490 MB/s during our write test and 516 MB/s in our read tests. With speeds like these you can even run an OS off the Samsung T5 and not

tell the difference between this and one running off an internal SSD. In order to get these speeds, you will need a USB 3.1 Gen 2 port on whatever you want to connect this to. For about 13.5K, a 500 GB Samsung T5 is just about the same as most internal SSDs, so in a way you can say that you're getting the portability thrown in for free, with the added benefit of great performance. Overall, this is a great option to satisfy your external SSD needs.

GIGABYTE X299 AORUS Gaming 7

Just about the same as the Gaming 9

If the Gaming 9 was a little too much for you, GIGABYTE has the X299 AORUS Gaming 7 for a lot lower price but with not as much a compromise on the features. It has the same eight phases for the CPU VCore which can be seen at the very top of the motherboard. And they're using an Infineon IR35201 as the digital PWM with IR3556 mosfet rated at 50A for each of the individual phases. This configuration is the same as the Gaming 9. Coming down to the expansion slots, we see there are five physical PCIe x16 slots allowing for multi-GPU configurations involving double and triple slot graphics cards. This is, again, just the same as

what the Gaming 9 sports.

So, after all the good stuff, let's get down to what you're missing out in the Gaming 7. You don't have an integrated rear I/O shield, you have fewer PCIe switches, fewer M.2

shields, the audio solution doesn't have BurrBrown OP-AMPs, and there is no back plate on the underside of the board. Overall, for a lot less money, you are getting a very similar board as the Gaming 9. Thus, you're getting a lot more value for your money with this board than what the competition can offer right now – which can be really crucial if you're making a gaming build and are strapped for funds.
