

SCIENCE IS THE PATH TO KNOWLEDGE, AND FINDING OUT ABOUT HOW OUR UNIVERSE WORKS. YOU CAN'T BE A GEEK AND NOT KNOW YOUR SCIENCE!

LET'S EXPLORE

THIS MONTH IN SCIENCE: Deep dive into the new and exciting world of Quantum Biology. Sounds strange? We thought so too.

Mystery void in the Great Pyramid of Giza

Using equipment meant for particle physics experiments, researchers have discovered a previously undiscovered void in the Pyramid of Giza. This cavity is the first major discovery at the pyramid since the 19th century. While the particle-detector revealed the size of the void, it failed to throw light on any structures within it.

WHAT'S NEW

Whales and dolphins have bigger brains because they are more social

H

Humans are pretty smart, especially compared to the rest of the animal kingdom. While there has been debate

over the primary cause behind this smartness, several theories indicate a correlation between the social nature of humans and size of their brains. While there's similar results for primates and birds too, a new study indicates this to be true for whales and dolphins as well!

The study took into account several factors, including the typical body size of the species being analysed, the typical social group and also the numerous social activities that whales and dolphins partake in, like group hunting, play,

social learning, and complex calls. The results fall in line with the idea that species that are comparatively more social have bigger brains.

No such thing as gaming addiction

While many of us are proud of our binge-gaming sessions, for some, an addiction to gaming can be a serious issue. However, a new study indicates that people in such situations aren't really addicted to gaming itself, but are instead using it as a means to escape the other dysfunctional portions of their lives.

During the course of the study, participants were

required to fill questionnaires about their lives and gaming habits. Over time, there wasn't significant growth in intensity or instances of gaming addiction.

However, wherever the addiction was seen to be quelling, there was a corresponding rise in contentment with some other part of the participant's life - be it career, personal life or other areas. So in effect those who game excessively do so because their life isn't as fulfilling in other parts. Maybe we should volunteer some of our SKOAR! writers for the study!

Heart surgeries go well in the afternoon

A study published in the Lancet indicates that heart surgeries carried out in the afternoon have a better rate of success. This phenomenon is attributed to the circadian rhythm of the cardiovascular system, which is at peak efficiency during the afternoon.

Marijuana creativity is a myth

Research indicates that the creativity commonly attributed to marijuana is actually due to user's openness to new experiences. To put it simply, the same personality traits compel people to use marijuana and be more creative.

Brain exercise for dementia prevention

New aging research has identified a form of mental exercise that greatly reduces the risk of dementia in participants. The training consisted of 10 one-hour sessions over six weeks initially and up to eight booster sessions after that.
