Investing in Cryptocurrency

T

he debate regarding whether the current cryptocurrency trading craze is a bubble or not is a

debate that is seeing no end.

But the reality is, many people are actually investing in cryptocurrencies and seem to be making money out of it. This brings us to the question: Should you invest in cryptocurrencies or sit this one out?

That decision is for you to make. But if you wish to make the investment, here is a handy guide for you. But please know that the content provided here is meant for general information and shouldn't be taken as professional advice.

A FAIR WARNING

If you wish to invest in cryptocurrency, go into it with the knowledge that you may end up losing a lot. Because at this point, no one knows whether the crypto-craze that has swept the world is just a passing fad or not. Ideally, you should set aside to invest in cryptocurrency whatever money that could afford to lose. Take whatever amount you're fine with, and leave it in for a few months to see if it make gains.

STARTING UP

First of all, you are going to need a digital account if you need to hold cryptocurrency. A digital account could be an exchange or a wallet. Either way, it would have two key features: a public key and a private key. These keys are what helps ensure that your cryptocurrency holdings are kept securely in the digital system.

From the things you need to start investing to choosing the best cryptocurrencies and making the right exit strategies, here is a comprehensive guide to investing in cryptocurrencies.

Dhinoj Dings | feedback@digit.in

The public key is very much similar to a typical bank account number. You could share this with others so that they could transfer the money to you. In other words, the public key is used to receive the money that's deposited to an account. The private key, on the other hand is linked to the public key for the same account, and helps authenticate a cryptotransaction.

So, now that you know about private and public keys, let's take a closer look at wallets and exchanges

Wallet

To store your cryptocurrencies, you are going to need a wallet. The most common options include paper wallet, hardware wallet and digital wallet.

Paper wallet is one in which you actually print your keys on a piece of

paper and keep it safe. bitaddress.com is a good option in this regard. Hardware wallet is a removable drive. Though expensive, it's said to be the most secure method for storing cryptocurrencies. To buy one, you could approach an authorized reseller like Etherbit. Digital wallet refers to any program that runs as a mobile or desktop app to help you store the cryptocurrencies. BuyUcoin is an example of this. BuyUcoin also provides you an Exchange (see next section).

Exchange

The exchange is where you buy and sell cryptocurrencies, synonymous with the stock exchange for commodities trading. We have listed the best exchanges available in India further down below.

THE RISKS INVOLVED

Bitcoin is the most popular and among the highest trading cryptocurrencies around. So you may wish to choose that as an investment option. But before doing that be warned that the Indian government has issued a warning that says investment in Bitcoins is very risky. So if one day the government makes buying and trading in cryptocurrencies illegal,

It'll be a while before you can turn a profit from mining.
