

macOS bug for root access

macOS High Sierra bug grants root access to a machine by leaving the password field blank. <http://digit.in/macBug>

Facebook may ask for selfie

Some users have reported a new type of captcha on Facebook that requires uploading a selfie for identity verification. <http://digit.in/FBCptcha>

Build your own chatbot without coding

Want to make your own talking assistant without a single line of code? Here's how it can be done

Arbab Mukherjee | arnab@digit.in

R

ight now, there's a lot of buzz around chatbots and how they're going to take over from apps. While we're reserving

judgement on that until we have more data, it doesn't hurt to create a chatbot yourself anyway. Thanks to a rising interest in them, a lot of platforms have been created where you can build your own chatbot without knowing how to write a single line of code.

PLATFORMS

There are just too many 'make a bot without coding' platforms out there to analyse in one workshop – each with their own pros and cons. While standard platforms from big names like Facebook and Google are available, there are other popular alternatives like Botsify as well in the fray. Here's what they are good for in brief:

- **Dialogflow:** Formerly Api.ai, Google's chatbot development platform plugs into Google's machine learning expertise. Divided into intents and entities, you only need to provide a few possible queries for each intent and Dialogflow handles the rest.
- **Messenger:** This is essentially Facebook's platform for developing bots for Facebook Messenger, which is the platform of choice if you want to reach a big audience.
- **Botsify:** With Botsify, you get plugins that are easy to setup for stuff like your RSS Feed and more. We're

going with Botsify on this workshop because we intend to use it to develop an RSS feed bot.

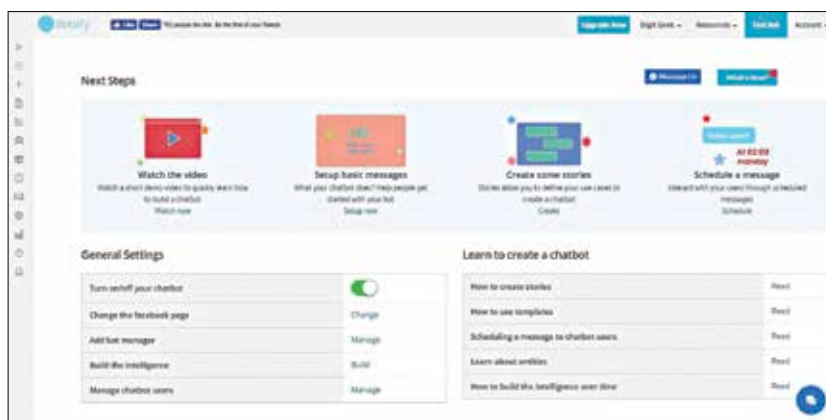

- **Slack:** If you want to build a bot for enterprise usage, or have some team-specific use cases in mind, then developing a bot for Slack using the Slack API is your best bet.

BOT BUILDING WITH BOTSIFY

After logging in with your Facebook account (which is recommended, especially if you're trying to make a Mes-

need to set up three types of messages:

- **Greeting message:** This is what appears as a message before the user has clicked the Get Started button on Messenger. You can use user parameters like `{first name}` from a dropdown to personalise the message.
- **Get Started button:** This is what determines how your bot responds to a Hi, Hello or other initial messages. You can choose simple text responses, templates, stories or plugins. Our bot is intended to browse

Botsify Dashboard: This is where you can start off building your chatbot with some basic steps

senger bot), you start off by selecting the purpose for your chatbot – whether it is a generic bot that you intend to link to your Facebook page or Slack account, or whether it will be deployed on your website – which is a premium template.

We decided to build a chatbot for the Digit Geek Facebook page which would help you find articles that are published on the website. The process is easy: select a name, followed by the Facebook page where you want this to run and then go through the following steps.

Step 1: Setup basic messages

This interface is to decide how your bot behaves at the very beginning of an interaction. We chose 'Generic bot for a Facebook page' as our target, so we

the Digit Geek website, so we set up a template to prompt the user with a Category menu.

- **Default Message:** This is what the bot responds with if it doesn't understand something. It is good to keep a couple of options here so that the failure messages aren't repetitive.

Step 2: Set up templates

Mouse over the main menu on the left and click on template designer. We'll be creating two templates here:

- **Menu:**
 - Select the Generic Template
 - Click on the Image button to provide link to the image for the first card, and provide Title and Subtitle from respective buttons.
