- Click on Plugin button and select RSS plugin. Provide the URL to the RSS feed and other attributes,

'Menu' from the drop down list, which is essentially the template from the previous step.

Creating a template to be returned to the user

hit 'Edit' on the floating window to save it, then provide a title for the Button and hit 'Edit' again.

- Add as many cards needed on the right. These cards can also point to weblinks that can be added by the weblink button.
- FirstResponse:**
 - Select the Button Template.
 - Similar to Menu, provide Text for the message box.
 - Click on Template button, add a title for the Button and select

That's it for click-based interactions. Now for the chat-based interactions.

Step 3: Set up stories

- Go to the main menu and click on New Story.
- You can choose the criteria for a response to be a keyword, a phrase or an entity (more on that later). Go with keyword.
- For this chatbot, specify the categories from the website with as many keywords as possible. For instance,

for Tech, you would use variations like Technology, Gadgets, Techs, etc.

- Specify a 'Bot says' message followed by a Plugin response, where you will have to select the RSS feed and proceed similarly as before. Do this for as many categories as possible.
- Depending on how many RSS feeds are available, you can (and should) create as many stories as possible to account for various user interactions.

Step 4: Optimise

All the steps so far have been to set up the chatbot and it should be operational by now. You can optimise it by doing one or many of the following:

- Go to Learning and Understanding to specify phrases that are similar to existing stories.
- Go to Live chat to monitor chats in real time and link missed phrases/ words to similar stories

There's a lot more you can do if you play around with the settings. And don't forget to checkout the Digit Geek chatbot on our Facebook page here: <https://www.facebook.com/digitgeek/>.

We are hiring.
