

Windows Hello face spoofing

Anyone can bypass Windows Hello-based facial recognition in older versions of Windows 10 with printed photo <http://dgit.in/FlawWin10>

Self-healing glass, by accident?

A University of Tokyo student accidentally discovered a new type of polymer glass which can mend itself when pressed together. <http://dgit.in/OopsHeal>

Creating a Dialogflow Intent

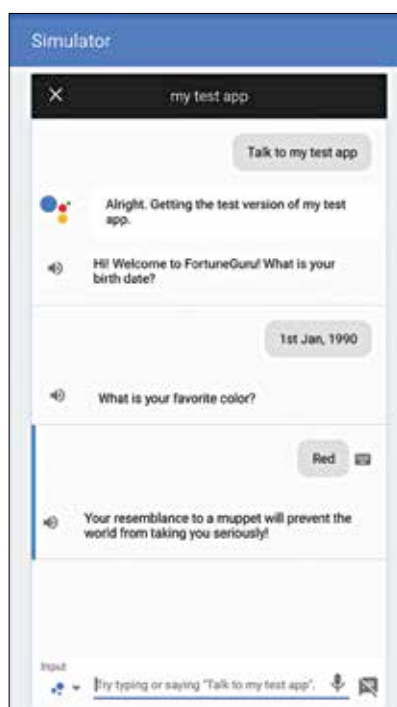

PREPARE FOR DEPLOYMENT

When you submit your app for approval, Google expects and verifies that they meet a minimal set of requirements before publishing them to users. Use the following pointers to prepare your app and submit them for review.

- **Check for policy violations:** Verify that your action follows the policies for Actions on Google.
- **Be specific:** Users must be able to call your invocation, specifically. Don't be too abstract or general, since you want users to trigger your action. For example, use "Talk to WeatherApp to check the weather for [city]" instead of "Check the weather for [city]" as the appropriate action phrase.
- **Avoid prohibited content:** Unless it serves a scientific, artistic or educational purpose, apps with explicitly sexual, violent, illegal, or hateful content violate the policies and will consequently be rejected or taken down.
- **Respect copyrights and intellectual property:** Make sure you have adequate rights to use the content offered by your app.
- **Be honest:** Don't mislead or deceive

users with false claims or promises and always be clear about what your app can exactly do.

- **Protect users' privacy and security:** Be transparent in how you handle user data, transmit user data securely, and provide a general privacy or data policy.

A simulation of a conversation with the FortuneGuru app

- **Don't listen to users unprompted:** Make sure your app notifies the user when it's waiting for a command, to reduce the risk that your app is rejected. It is against the policies to listen to a user without explicitly specifying a 'prompt' that notifies them of such behaviour.
- **Review your invocation and display names:** Make sure your invocation name is consistent with the display name, and that both are specific enough that users can easily call your action. Your invocation and display names must also follow the policies for Actions on Google. This is how people will instinctively know how to initiate a conversation with your app or give it a command, so yeah, this is quite important.

TEST YOUR APP

This is when you make sure everything works. Check for the common errors and violations such as the Transport Protocol's security, verification of the HTTPs (TLS) encryption on the transport for your webhooks. Then go ahead and ensure that you're signing your webhook requests and verifying them in your webhook.

Disable SmallTalk, if you want to avoid answers to inquiries like "hello" and "goodbye". Not all apps are intended to be chatty.

Also, make sure that the app name you've set consistently triggers your app. Use a hardware device and speak your invocation name repeatedly, in real-world scenarios (i.e., with noise in the background, or at different distances from the device). If your invocation name is not consistently recognized, you may need to look at a way to change it.

Finally, try to test on real devices. While the web simulator is great for testing your app quickly during development, you should always test invocation and dialogs on real devices, such as voice-activated speakers. This is the best way to be sure about the functioning of your app in real life so that you can go ahead and create a truly fulfilling experience for the user.
