

HOLHO

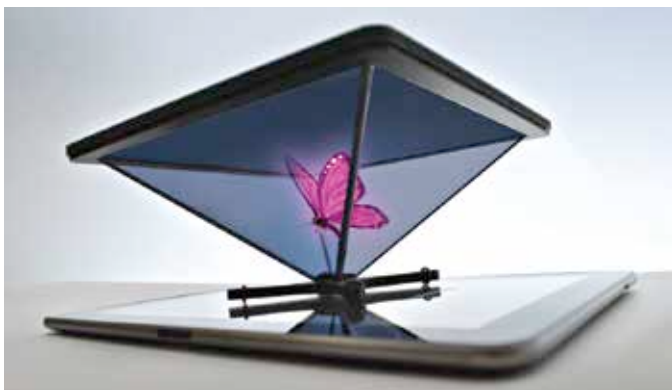

Funding: \$13,463 of \$5,200 goal

Link: <http://dgit.in/HolhoHolo>

HOLHO is a device that comes in two possible shapes, a pyramid or a z-shaped rack called zed. What they do is enable your smartphones or tablets to display holographic video or images. In order to do so, you need to place the pyramid or mount the zed on your device in a specific way. For the pyramid, the image or video on the display is split into 4, and the tip of the pyramid is placed between the four images. The hologram is displayed in the centre of the pyramid.

This is not the case for the zed. You simply place the tablet in the slot provided for it at the top zed and it projects the hologram. Of course, you can't just convert anything into a hologram, you will need a very specific type of video or image. HOLHO has their own channel with a selection of such images and videos which you can use. They also have a holo converter for HOLHO pyramid users which will allow them to create their own holographic content.

This isn't HOLHO's first stint on Kickstarter, they've had campaigns on the platform a couple times before but unlike the last two times, this time Holho has toned the size down and made the devices much more portable with the ability to be disassembled and reassembled. You can find HOLHO on Kickstarter.

Yeehaw Wand

Funding: \$58,147 of \$25,000 goal

Link: <http://dgit.in/WandYeehaw>

Imagine being able to draw stuff mid-air. Now imagine being able to not only draw them, but bring those creations to reality as well. That's what the Yeehaw wand offers.

The Yeehaw Wand is an AR accessory that lets you create and design in 3D. All you need is the Yeehaw app – although, the wand is compatible with other AR apps as well.

The Yeehaw wand comes with a 360 degree plate as well, which acts a base for your creations. You can rotate the plate to rotate your creation in AR in real time. It's quite handy to change perspective and take a good look at your creation from all angles! And we mean ALL angles, you can pick the plate up and tilt it sideways and upside-down and your creation will mimic its movements. Once you're done creating, you can 3D print your creation. Yeehaw claim that they have no problems printing creations for wand users and shipping it to them but if you've got a 3D printer of your own, your creation is saved in a printable format. Additionally, you can also pick up have Yeehaw's own 3D printer from their Kickstarter page.

OneManBand

Funding: \$188,322 of \$50,000 goal

Link: <http://dgit.in/OMBGuitar>

OneManBand or OMB is a digital backup band that adjusts and adds playback to your guitar playing in real-time. It also lets you play your guitar as different instruments, i.e., enables it to make other instruments' sounds with no latency. OMB's band uses software that's compatible with any style of guitar playing. The device detects signals from the strings via capacitive and inductive tech and converts that into data which decides on what the right playback

will be. The same tech is used when using the band and your guitar to mimic other instruments. While OMB should work with any metallic non-coated strings, they recommend using their own strings, or even better, their own guitars for the best experience. OMB comes with an app

which controls most of the band's features, you also have the option to go for a pedal, for a "hands-free" experience. The pedal features all the buttons you'll need to control OMB.

OMB features various modes, the first is Playback Mode, where the playback follows your lead. The playback is dynamic and changes with your playing in real-time. Then you have Instrument Mode, which allows you to simulate other instruments on your guitar. Lastly you have the Guitar to MIDI feature. This makes it all the more easier to compose music by turning your guitar into a MIDI controller. Definitely a handy tool for prospective musicians out there. Find OneManBand on Kickstarter.
