Logitech G603

Impressive battery life, decent sensor performance

Logitech's new HERO optical sensor on the G603 performed surprisingly well, even better than a few wired gaming mice that we have tested. There's no visible lag and no tracking issues. Enotus Mouse Test displayed impressive performance, while it gave decent scores in MouseTester. Based on these scores, we can definitely say that the sensor is capable of handling some serious gaming. We found anomalies when it came to the polling rate. We recorded random drops and slight jumps in the polling rate, pointing to either a power saving mode or erroneous sensor reporting. However, this didn't hamper

gameplay and since these errors exist for now, we wouldn't recommend this mouse for competitive gameplay yet.

The G603 operates in two modes. The Hi mode pumps the maximum polling rate to 1,000 Hz while Low keeps it limited to 125 Hz. We didn't notice any problems while playing FPS games on the Low mode. The Hi

mode will last you up to 500 hours while the Low mode will let you run the mouse for 18 months on the included AA batteries. The ergonomic shape is comfortable and the build quality is sturdy. There's no fancy LED lighting other than the DPI indicator, which is a great decision to conserve battery. Wireless connectivity with good performance comes at a higher price, and if you're looking forward to declutter your desk, this could be the mouse you were looking for.

Antec P8

Tempered glass side panel on an affordable cabinet

Functional or not, a tempered glass side panel completely transforms the look of a cabinet. Now, you can have this luxury on an affordable cabinet. With a minimalist design, you get a decent cabinet with the bare minimum features necessary. The build quality is nice and the motherboard plate doesn't bend easily. There are no rubber grommets around the cutouts, but this is the case with other cabinets in this range. You can hide away all the extra cables under the PSU shroud. The shroud also contains two drive slots for HDDs. Cable management is average on this one even though you will be able to assemble a clean build.

The performance was below average. Synthetic benchmarks revealed the i7-4960X touching a maximum of 64 degrees Celsius while the HD 7790 GPU reached 67

degrees. In real world testing, the temperatures were within acceptable ranges. Cooling support is sufficient, you can install a huge 360mm radiator on the front panel. If you're buying this cabinet, it's not going to be because it offers you great cooling performance, but because it looks great and includes a tempered glass side panel at such a low price.
