

THE TECH BEHIND AGI

WONDERING WHAT KIND OF TECHNOLOGY WILL BIRTH THE FIRST AGI?

Mithun Mohandas | mithun@digit.in

Nope. It's not happening anytime soon. We don't have the hardware, we don't have the software and we definitely don't have the data. Artificial Intelligence is certainly progressing in an exponential manner, but we're still far from the first Artificial General Intelligence (AGI). If you haven't come across that term in any of the other stories, AGI is human-like intelligence. There is no real world

example to help you better understand the concept, however, it has been featured a zillion times over in popular pieces of science fiction. Remember Jarvis? Tony Stark's (*Iron Man*) AI butler? Go a couple years further back and then there's KITT from *Knight Rider*. To be honest, we'd like to give you a proper estimate of when we could see it, but when the world's foremost experts in the domain can't agree, we don't stand a chance at doing any better, but we're still going to try.

The quest for AGI

Researchers predict that we'll have functional forms of AI that can replace humans engaged in certain tasks. We'll have true human language translation by 2024, capability of writing high-school essays by 2026, autonomous trucks by 2027, retail helps by 2031, the next GRRM (George R. R. Martin) by 2049 and the best surgeon by 2053. They say that there's a 50 per cent chance that AI will outperform humans in the next 45 years and around 120 years,
