

Logitech Bridge

The Logitech Bridge is a virtual reality accessory kit which lets you see and use its keyboards while you're inside VR. The software positions a 3D virtual keyboard model exactly where your actual keyboard is placed. This is quite the boon, especially on the development side of things when it comes to VR.

Normally when you think VR, you're thinking motion sticks and motion control. However, a lot of VR apps in the market right now are built around and on VR desktops and rely on keyboards. If you're someone who can touch-type, you might get by but that's not always the case. The moment you take your hands off, getting back in position without taking your headset off can be a bit of a hassle.

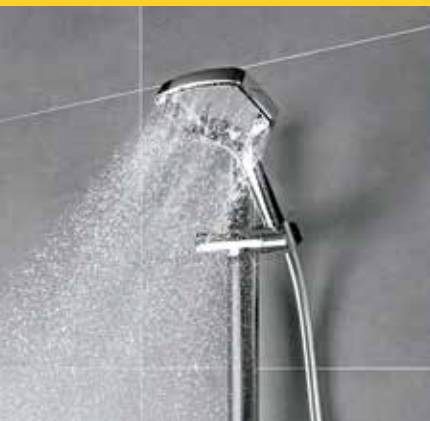

Logitech's Bridge software also lets you overlay custom keyboard layouts. Meaning you could replace buttons with shortcuts or hotkeys as you need them. For the time being it works with any game or app which uses HTC Vive and SteamVR.

In order to use the system you will need a tracker disc, which will set you back by \$99. That's in addition to the software itself which is priced at \$150. One issue with the software is that it'll only work with Logitech keyboards, specifically the options you have available to you in the software. So if you've got a fancy gaming keyboard from a company other than Logitech, chances are it's not going to work with this software.

Rua

We came across the Rua shower head when we were gallivanting across the various crowd-funding sites. The Rua showerhead stood out because it promised more shower power and coverage while at the same time saving water.

The first thing that immediately stands out about the Rua is its design. It's very different from conventional shower-heads. It looks like a rectangular loop with rounded edges. There's nothing in between, that loop is the showerhead. The water sprays from nozzles that are in that loop.

Water spray from the Rua is also different, Rua claims that it can

generate much bigger water droplets than conventional showers, up to 20 percent larger. The spray system is also evened out and much wider, covering more area. You may have come across a situation where the water pressure while using the shower was particularly strong in one area and little to nothing in another, this is common in traditional needle jet showers (the kind most of us have). Rua promises even pressure and coverage throughout. The average shower uses up about 8 litres of water per minute. Rua on the other hand uses 6.8 litres of water per minute. That's a significant amount of water saved.

Malawi

Not everyone lives in a big apartment or house with enough room for a vegetable garden or really anything other than stuff you need to have, you know, like a bed and stuff.

Startup Just Grow has come up with a way for you to be able to have a garden. And the garden doubles as an aquarium too. They call it Malawi.

Malawi is an indoor garden that sits on top of an aquarium. It takes very little space and will sit snugly in any place you could otherwise place a microwave or oven. Just Grow claims that the best part about Malawi is that it takes very little maintenance, just a couple minutes of your time per day.

A pump cycles water from the aquarium to the garden above. Bacteria in the garden covert fish waste into nutrients for the plants. This acts as a natural filter for the aquarium as well, so very little to do for you. No need to change the filter or the water or the usual hassles that come with owning an aquarium.
