

DOES THIS SECTION EVEN NEED AN INTRODUCTION? FROM COMPUTERS TO MOBILES, AND HEADPHONES TO GPUS, IT'S ALL HERE...

C'EST LA VIE

THIS MONTH IN TECH:

CES is always expected to be a whirlwind of amazing gadgets and technology being unleashed upon the whole world, and 2018 was no different. Hence, we decided to dedicate this entire, expanded section to bring the best of CES to you. After all, as the title indicates, tech is life!

Updates to promising products

Apart from the brand new stuff unveiled at CES, we also saw a lot of updates to products promised in previous editions of the show. One such product was the SGNL wristband that will be shipping by March this year.

WHAT'S NEW

Best of CES

The first month of 2018 brought along this year's CES, and with it, a host of new gadgets and technology. Here are our top picks from the biggest technology show on the planet.

TV pioneers

Samsung The Wall microLED modular TV, LG rolling 4K TV

This year's CES was already being predicted to be significant for TVs when it was around the corner. Samsung and LG have fulfilled those predictions with their own innovative TVs at the event. Samsung has introduced The Wall, a 146-inch modular TV with microLED technology. The modular aspect here is that you can take more than one of these and bring them together to cover entire walls as and when required, which essentially is an implementation that Samsung had showcased in 2016 on a smaller scale. Also, microLEDs are much smaller than regular LEDs and offer darker blacks and better pictures in general – so expect good quality as well.

How can LG be far behind in the race for innovation in displays? This year saw the Korean giant bring out the first 4K rollable TV. LG had displayed an 18-inch rollable display in an earlier edition of CES, and this year the same has been expanded to a 65-inch unit that happens to be 4K as well – making it more believable as a

product that can actually ship to customers. Why would you need a rollable TV? For starters, you'll save precious living-room real estate if your TV can be rolled up and stashed somewhere inconspicuous. But more importantly, as LG demonstrated, your TV can roll to adjust the display size according to the content. That means switching between 16:9, 21:9 or something even wider would just be at the click of a remote! While the prototype unit seems to have a hefty, covered base for the TV to roll back into, final products may come with sleeker implementations.
