

Byton SUV

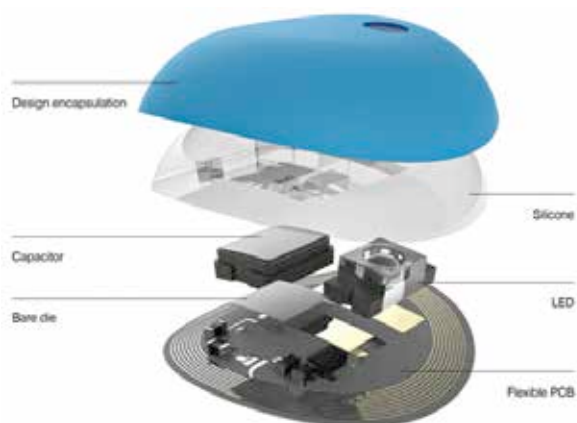

All electric, Level 4 autonomous SUV concept

CES has been called a de-facto auto show recently, because of how many concept cars are put on display. One such launch this year was the Byton SUV, which was as much of a gadget-packed extravaganza as it gets. Actually we wonder why it's still a concept. The modest suggested price of \$45,000 for the base model, the seemingly ordinary exterior, the average max speed of about 250 mph are all ordinary. However, it also has a massive screen spanning the dashboard, there's also an 8-inch tablet embedded into the steering wheel, the entire system supports a combination of facial recognition, voice activation and gesture control. A combination of other sensors and detectors make the SUV seem ready to replace your smartphone. The model set to launch in 2019 will come with Level 3 autonomy, while full autonomy is planned for 2020. <http://digit.in/SUVByton>

L'Oreal UV sense

Thumbnail sized sensor that tells you how much UV you've been exposed to in a day

One of the best wearables at CES this year was smaller than a thumbnail. The L'Oréal UV Sense is a tiny stick-on wearable that has but one goal – to measure a single person's UV exposure. On the one hand it is uncharacteristic of a cosmetic brand like L'Oréal to come out with an electronic device but on the other it is to do with skin and skin protection. The UV Sense does not require any charging or batteries, and connects to your phone over NFC – so a single scan is enough for your smartphone to extract the data stored on it. The app that it will connect with is supposed to ask you initial questions to set a baseline for your UV tolerance, and also recommend products for your once your exposure has been calculated. Replaceable adhesives make it reusable.

Aflac Duck

Smart soft toy that helps children suffering from cancer familiarise themselves with chemotherapy, and also express their emotions

Yes, we're all aware of the wacky side of CES, but did you ever think a soft toy would win most of the 'Unexpected innovation' awards in this year's edition? That's because the Aflac Duck is not just any soft toy. My Special Aflac Duck is a toy specifically designed for children with cancer to help them go through their treatment. With a total of five touch sensors spread around the body, the duck can sense when a kid pets it or snuggles with it and respond with a happy quack or even snuggle back. Additionally, the set comes with a bunch of RFID tags that the kids can slap on to the duck to make it express how they feel. There's also a mock IV (intravenous) set that lets the kids become the caretakers and administer IV to the duck, while

the duck emanates a peaceful heartbeat sound. A particular RFID tag shaped like a rocketship also lets the kids choose a destination via a paired app and then simulates the soundscape of that destination – be it a rainforest, an amusement park or somewhere else – in order to soothe children when they're in distress in a hospital environment. This isn't the first helpful soft-toy-health-tool from Sproutel. Jerry the Bear is a similar toy aimed at children with Type-1 diabetes, that comes with an entire kit to help them understand the condition.

Aflac, in partnership with Sproutel, is not planning to sell this duck. Rather, they're going to give one for free to every child diagnosed with cancer in USA. Amid all the eye candy at CES, this one won our hearts!
