

Turn off slow down in iOS

The next version of iOS will allow users to switch off the power management feature that slowed down the phones. <http://digit.in/iOS11-3>

Pacific Rim Uprising trailer #2

The sequel's new trailer gives us a better look of the Jaegers and what the world looks like after the first movie. <http://digit.in/PCR2Trlr>

GEEKING OUT WITH YOUR WEBCAM

Your webcam is capable of doing much greater things than staring at your face all day

Abhijit Dey | abhijit@digit.in

C

hances are that if you own a webcam, you have probably only used it for video calls on Skype or Hang-

outs. Or maybe, you might have used it to stream your gameplay on Twitch or YouTube. Apart from the above, there are a bunch of other ways in which you could put your webcam to use. And we aren't talking only about the fun tools that simply add filters over your face. We are talking about serious (albeit impractical) software and utilities that actually offer additional useful features. The best part about this is that you don't need an expensive webcam. However, if you want to completely geek out with the tools listed below, you could spend a little extra. It's time to pull off the tape (if you're among the paranoid ones) covering your webcam and geek out with the following tools.

HOME SURVEILLANCE SYSTEM

With a webcam at your disposal, you might naturally be inclined to tinker around with a home surveillance

system. Although "home" surveillance might sound too much of a stretch, we will use "room" surveillance since we assume that the webcam is in your room. Our choice for a free software is Netcam Studio, offering all the required features to record and remotely access your webcam. You'll have to set-up the server with your preferred configuration or the pre-configured ones installed for network cameras. Along with motion detection, you also get the option to enable audio detection. If you need a powerful surveillance software for free, you should definitely go for this. During our gaming streams, we were trying to looking for a solution to set up a multicam setup over the network. We came across Yawcam and this small webcam software makes it

super easy to start a stream and access it within the network. If you have more than one webcam at home, you can even add multiple sources to the same Netcam server. This will let you create your own DIY home surveillance system. Yawcam can also be used as a basic remote surveillance system.

FACIAL RECOGNITION

Another expected application of your webcam would be to use facial recognition to authenticate access to services. Earlier, you would come across many software that acted as a gatekeeper for your desktop. They gave you access only after recognising your face. But since Windows incorporated Windows Hello by default, those tools became redundant. However, you can still use facial recognition to authenticate your logins on several websites. There are a few Windows desktop apps (downloaded from the Microsoft Store) that support this feature through Windows Hello. But you'd have to individually install those apps. Intel's True Key is like
